US Pipeline Network

BP Pipeline System Overview

BP System Overview (Cont'd)

- The business unit operates and maintains over 9000 miles of onshore and offshore pipelines.
- Employs more than 2000 people throughout the country.
- Pipeline network transports approximately 2.5 million barrels/day of oil, refined products, natural gas liquids, natural gas, carbon dioxide and chemicals.
- Located primarily in the Midwest, Gulf Coast, West Coast and Gulf of Mexico regions.
- Terminal facilities consist of 70 light oil terminals located in 38 states.
- Terminals are supported by a fleet of over 500 transport trucks that deliver refined product daily.

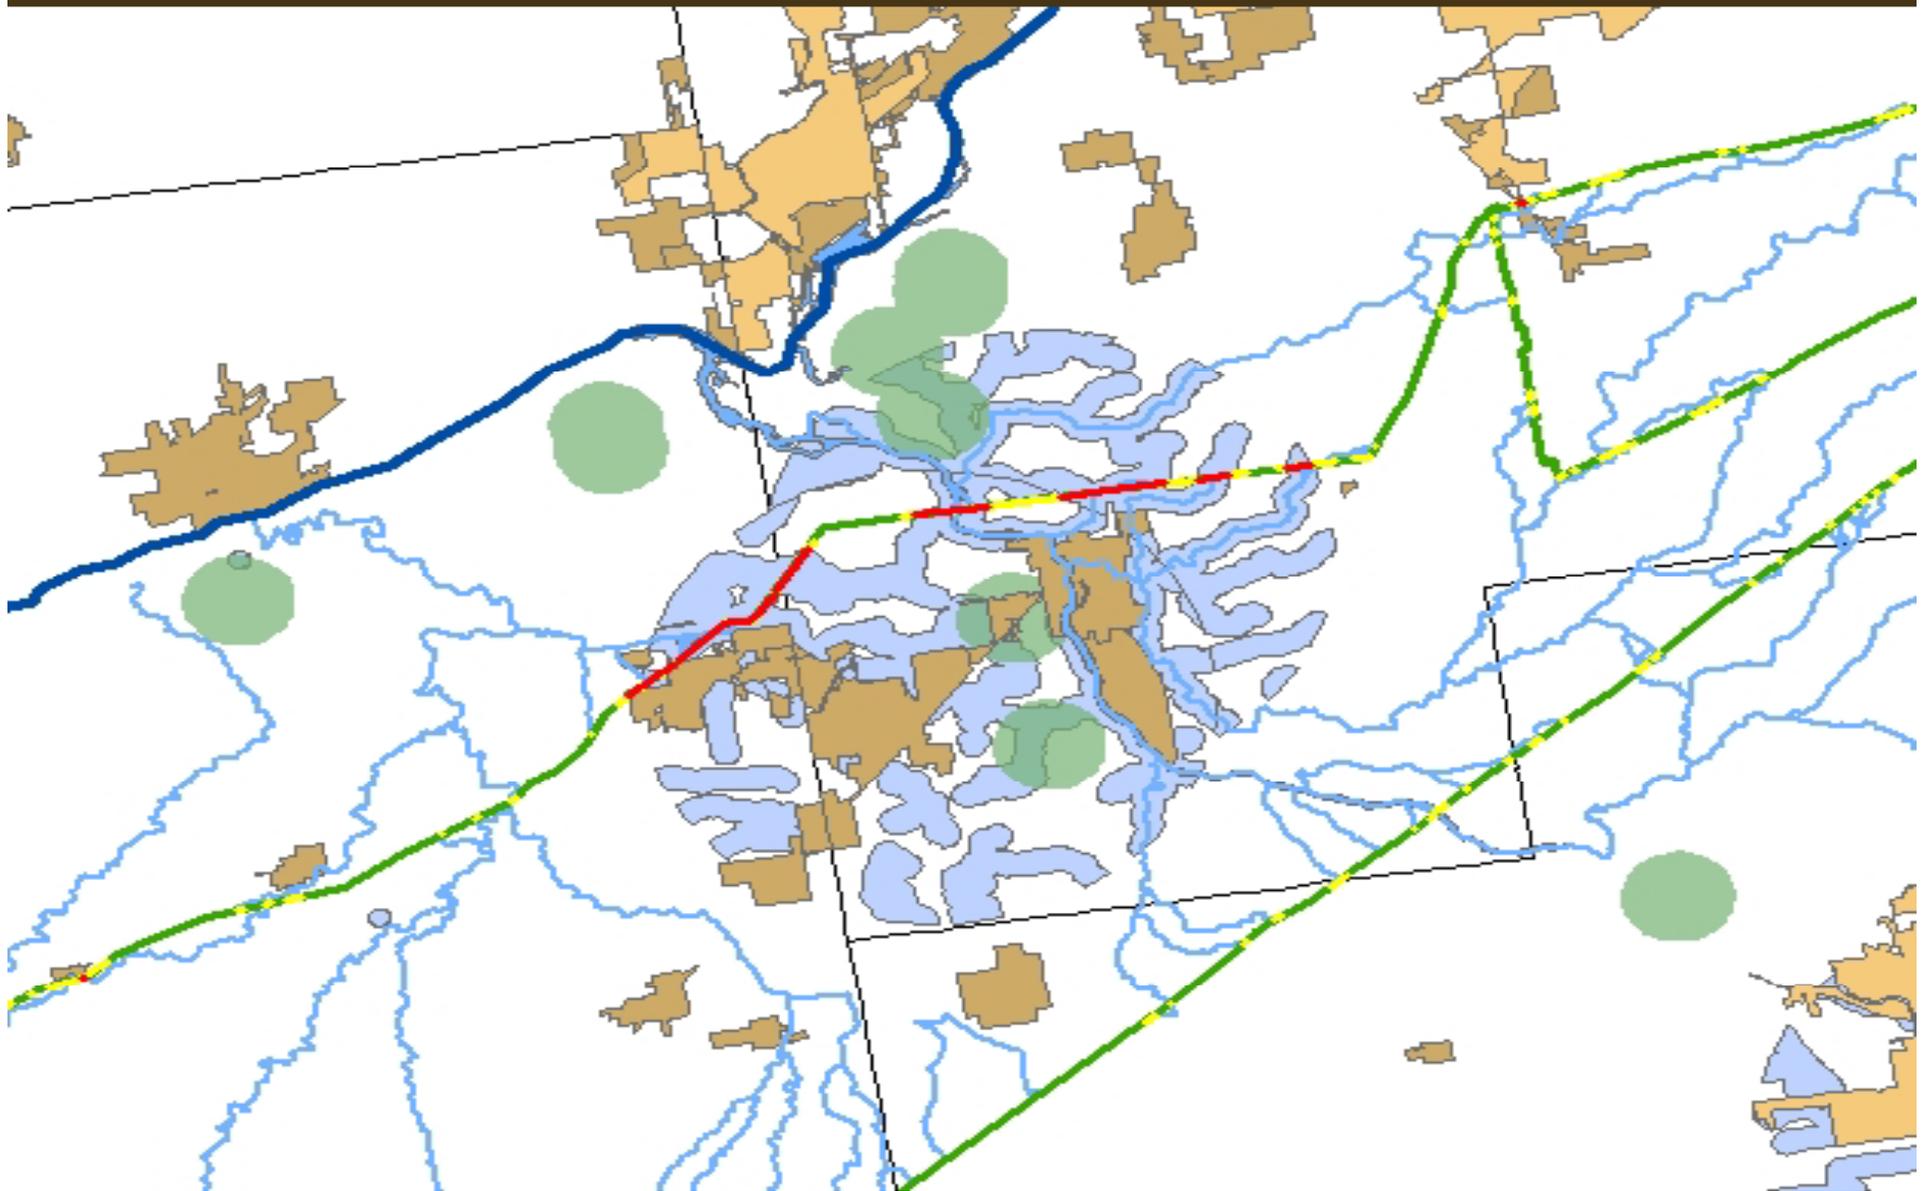

Key Business Drivers for Risk Assessment

- Assure pipeline safety, integrity and reliable operation
 - Identify unacceptable risk conditions along pipeline
- Compliance with Federal and State regulations
- Compliance with company policies and standards
- Establish priority
 - Risk ranking of pipeline segments for inspection and repair
- Provide for better allocation of resources
 - Enable the development of a multi year schedule and budget for pipeline assessments

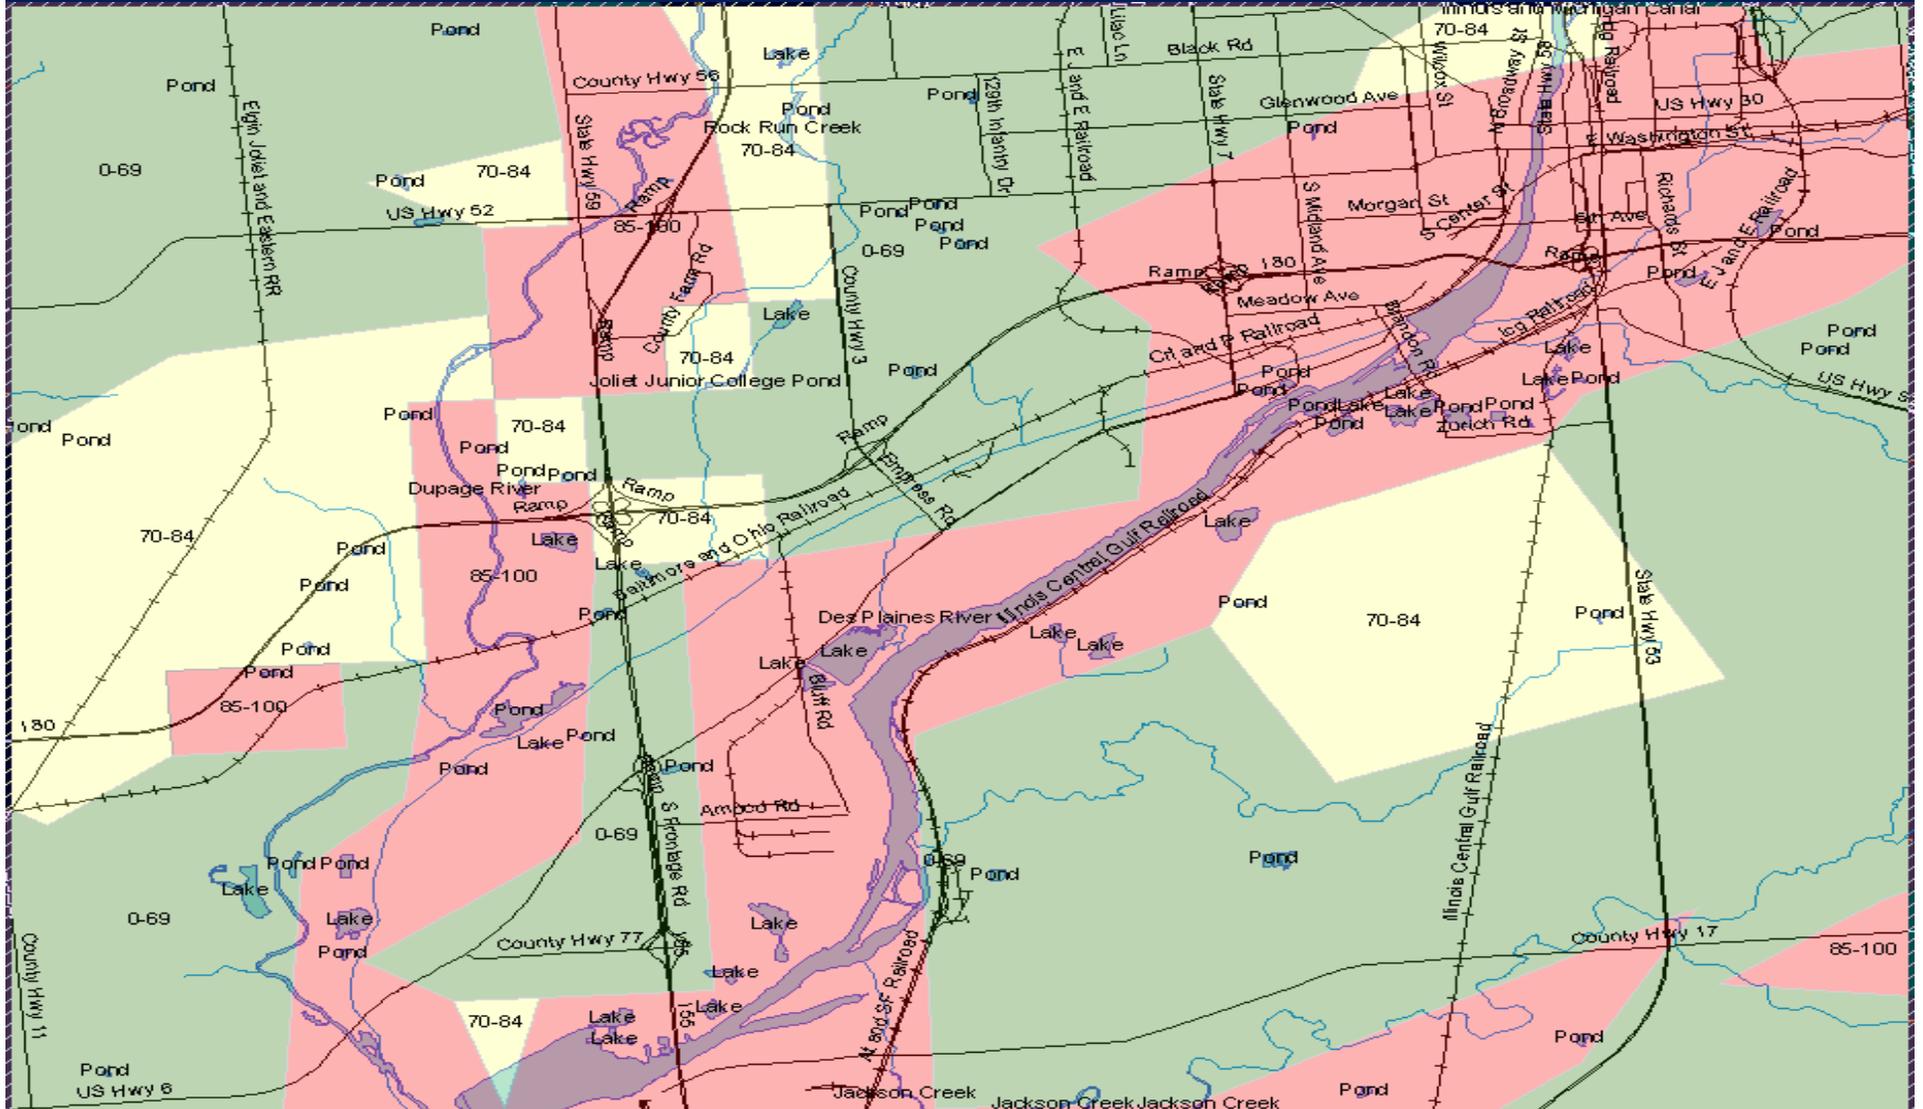

Pipeline Integrity Management Rule

- Enacted by Congress in 2001 with oversight by PHMSA (Pipeline Hazardous Materials Safety Authority).
- Requires operators to develop, execute and maintain a comprehensive Integrity Management Plan for all regulated lines.
- Identify pipeline segments that have potential to impact High Consequence Areas (HCA).
- Identify pipeline segments of higher risk and the subsequent factors driving those risks
- Develop a plan to reduce those risks.

Attributes

pipeline specs. (diameter, wall thickness, grade, seam, girth weld, coating)
installation date
operating pressure
flow rate
product type
pipe spans
leak history
CP history
One Call Effectiveness
last internal inspection date
last hydrotest date
natural hazard potential
(earthquake, flood, landslide, hurricane)

product type
rupture volume loss
dispersion potential
population impact potential
environmental impact potential

Spatial Risk Analysis

Demonstration

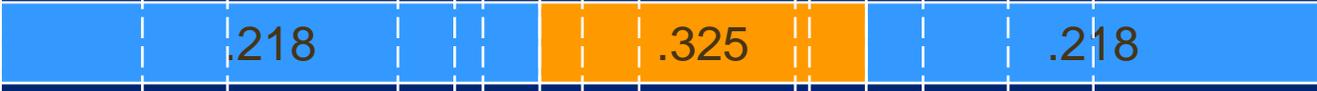

Dynamic Segmentation *Concept*

Wall Thk.	.218		.325		.218	
Grade	52000		60000		52000	
Coating	FBE			CTE		
HCA	Yes	No			Yes	
Road Proximity	>100'	50-100'	<50'		50-100'	>100'
Depth of Cover	24-36"	18-24"	36-48"		24-36"	36-48"
One Call	<5	5-10	10-20	<5		

Concept of Dynamic Segmentation

1. Slice the data based on all attribute changes.

Wall Thk.

Grade

Coating

HCA

2. Assign numeric values for attributes.

3. Apply risk formulas to calculate result

Risk Result

Related Business Uses

- Insurance Risk Assessment
- New Construction
 - Roads, Railroads, Fiber Cable, Utilities
- Real Estate Site Selection
 - Road Segmentation
 - Address ranges with score

Summary

- Spatial risk assessment techniques are used in the pipeline industry
- GIS data is very useful for risk assessment
- Demonstrated examples
 - Multiple data sources – tabular & spatial
 - User-defined risk model
 - Output – map, tabular, chart, etc.
- Technique can be applied in other industries
