

Customizing Graphics and MapTips with the .NET Web ADF

*Rex Hansen
Rich Zwaap*

Introductions

- **Who are we?**
 - ArcGIS Server Product Engineers
 - Manage the ArcGIS Server SDK for .NET technologies

- **Who are you?**
 - ASP.NET developers who want to learn more about graphics and map tips in the Web ADF

Schedule

Please!
Turn **OFF** cell phones
and paging devices

- Today we will cover

- Web ADF Graphics on the server and client
- MapTips on the client
- What's new in 9.3.1
- Q & A

- We will answer questions during session or at the end?

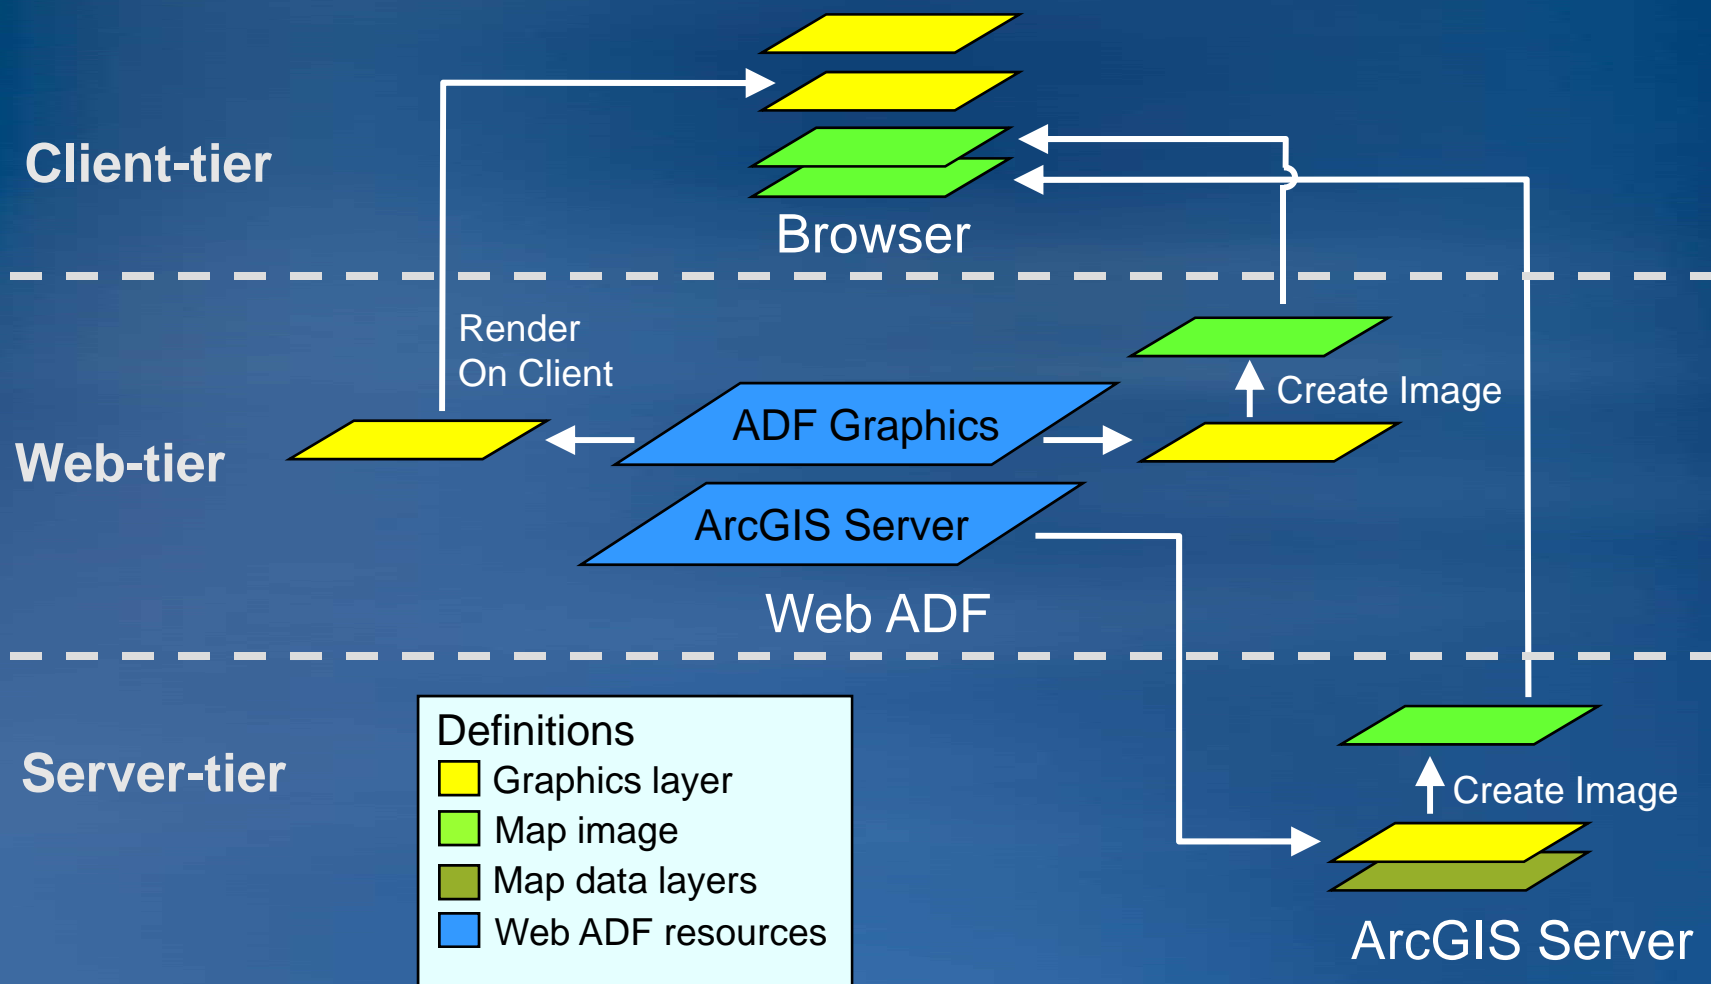

- Save all questions until the end

Please complete the session survey!

Web ADF Graphics

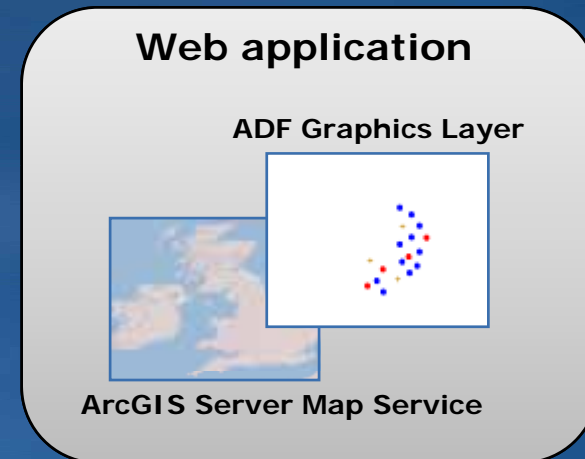

- **Web-tier .NET**
 - Spatially enabled .NET DataTables
 - Render on the server using GDI+ or the client using JavaScript graphics
- **Client-tier JavaScript**
 - Graphic features and groups
 - Callouts and MapTips
 - Layer formatting defines symbology and attribute display
 - Rendered using browser client technologies - e.g. HTML, SVG, VML

Graphics managed and rendered in multiple tiers

Creating graphics in the Web-tier

- Construct manually
- Query a layer in a resource (QueryFunctionality)
- Generated by ADF Controls (e.g. Tasks)
- Graphics map resources contain graphics layers

Displaying geometry in a graphics layer

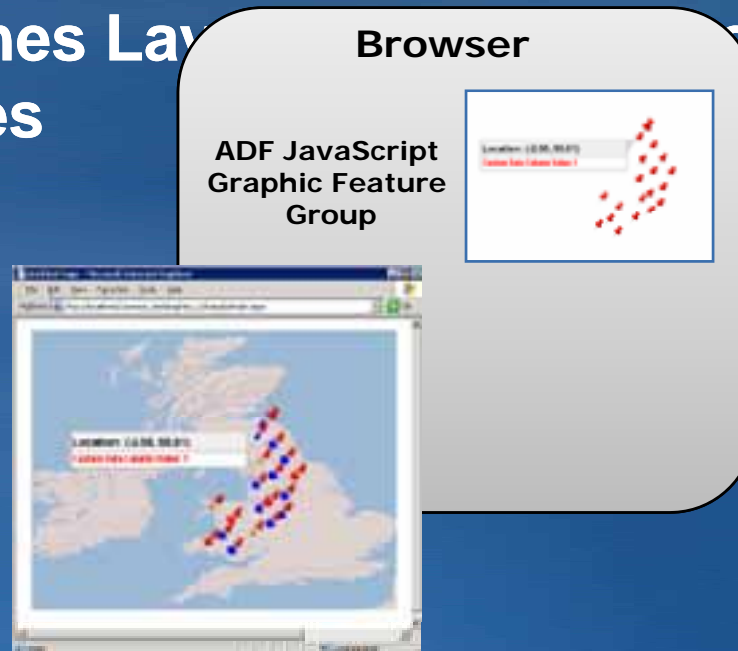

- **Symbols**
 - Based on geometry
 - Each graphic must be associated with a symbol
- **Renderers**
 - Apply to many graphics
 - Based on feature attributes
 - Container for symbols
 - Simple, unique value, and value range renderers available
- **Create custom renderers and symbols!**

Enhance performance

- **PostBackManager – SDK sample, manage AJAX requests behind the scenes**
- **Use generalize features to reduce retrieval time for queried features**
- **Use separate thread to process query**

Render Web-tier graphics on client

- **RenderOnClient = true**
- **Web-tier graphics layer emitted to client, creates graphic feature group with graphic features**
- **Layer Definition defines Layer to create client graphic features**
 - **Symbology**
 - **Map tip content**

Client graphics

- Create a graphic feature group, add graphic features
- Use graphic features to “mash-up” other services/data
 - GeoRSS feed
- Create a graduated symbol based on attributes

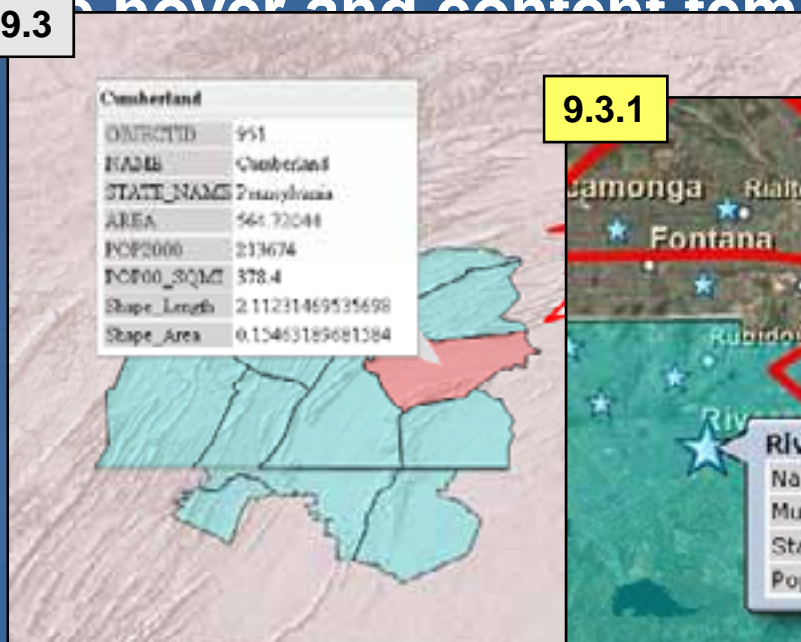

Best practices

- **Limit graphics rendered on the client**
 - To maintain appropriate performance
 - Initial rendering of client graphics may be time-consuming
- **Create and manage graphics in one tier**
 - Avoid client manipulation of graphics if created/managed in Web tier

Client MapTips

- Create MapTips client control (JavaScript)
- Change display based on attribute value
- Define hover and content template

9.3

9.3.1

MapTips templating – New 9.3.1

- **Create template**
- **Apply application's global template**
- **Apply layer specific template**

- **MapTip Layout Control**
 - Code gallery when 9.3.1 is released

Additional information

- MapTips control discussion
- Common MapTips sample

Summary

- **Today we covered**
 - Graphics in the ADF, on the client and server
 - MapTips customization on the client
 - New in 9.3.1, MapTips templates

Still have questions?
