

Integrating Information from LiDAR Data with your GIS

David A. Gonzalez

Exelis Visual Information Solutions

Agenda

- Trends fueling LiDAR analysis opportunities
- LiDAR as a valued source of information for your GIS
- Leveraging LiDAR for Decision Support Systems

Trend: Growing Prevalence of LiDAR Data

- Declining acquisition costs
- Flexible deployments
- Fast, accurate measures
- Easily survey remote areas

Trend: Evolution of LiDAR Resolution

From Terrain Updates

To Feature Extraction

Trend: The Convergence of Paradigms

Integrated Tools for Multidimensional Analysis

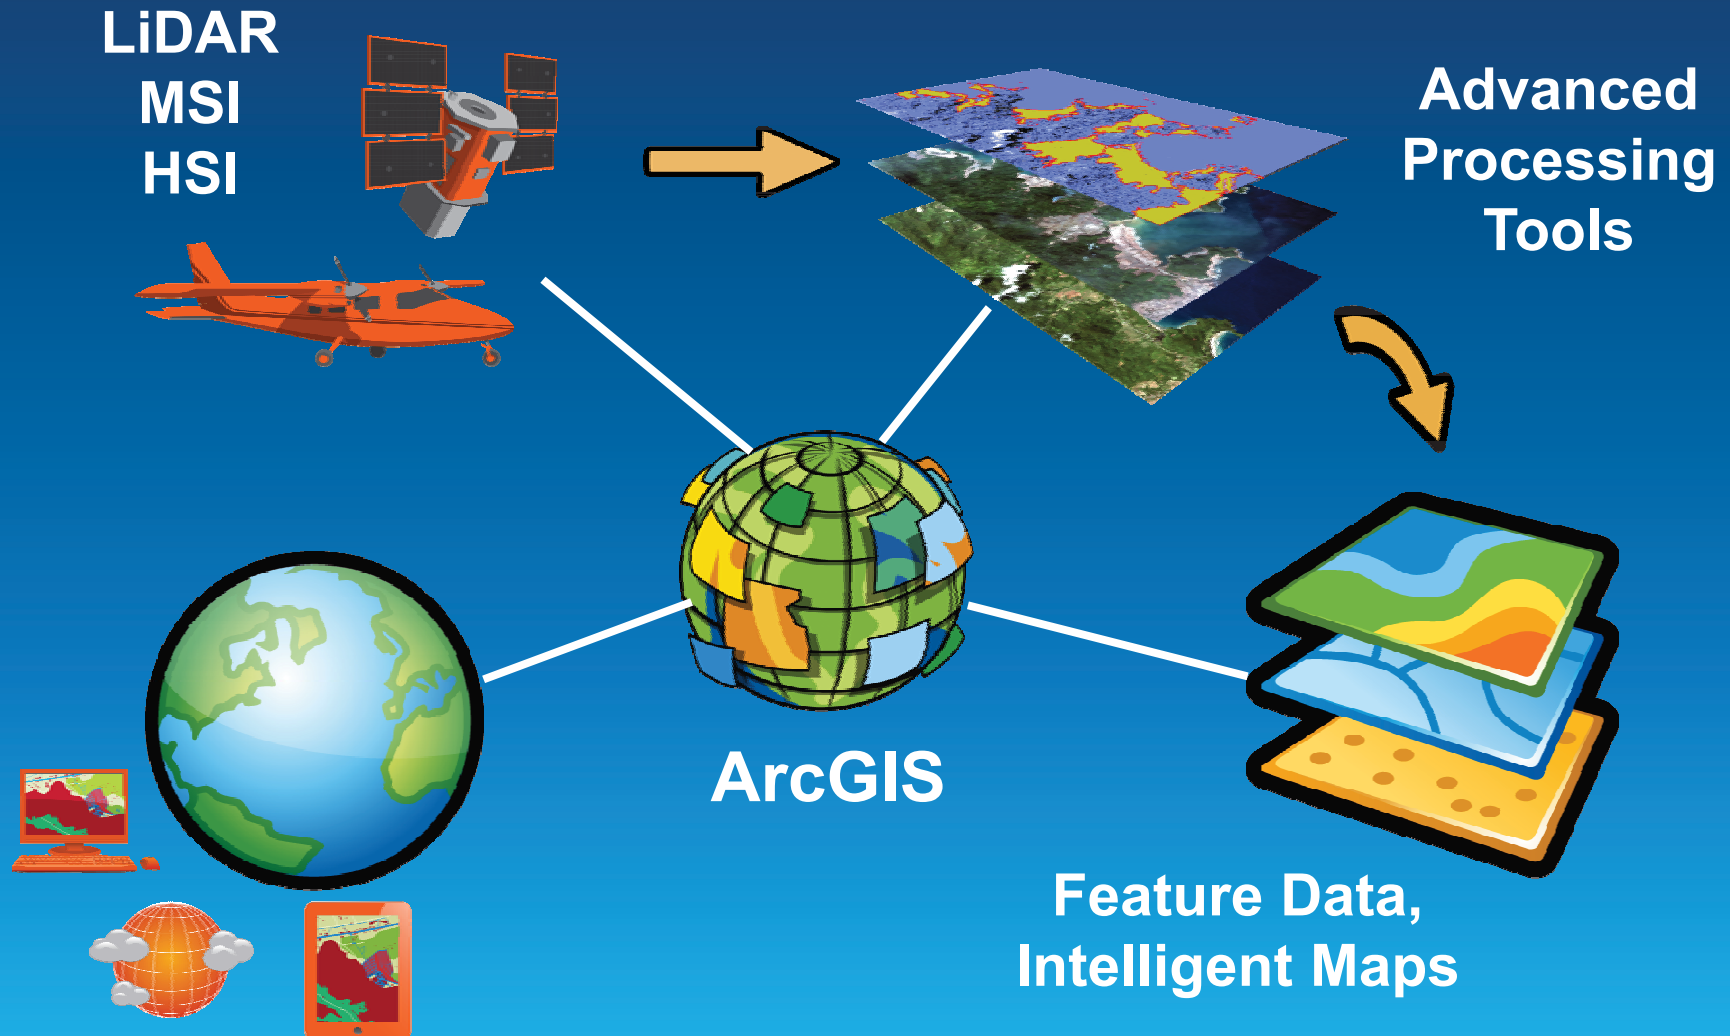

GIS

Remote Sensing

Transforming Spatial and Predictive Analysis

Trend: Advanced Analysis Tools and GIS Integration

LiDAR: Not Simply for Visualization

A Source for GIS Information that Drives a Variety of Applications

Approaches to Deriving LiDAR Information

Visual Interpretation: 3D visualization

- > Manual process, but familiar and expedient

Features Interpreted from Derivative Raster Products

- > Multi-step process
- > Feature delineations from interpolated height values
- > Use results with object-based FX

Features Extracted Directly from Point Clouds

- > Requires thicker point clouds
- > Based on 3D morphological filters
- > Proprietary or custom algorithms

Results of LiDAR Processing Methods: Products that Enable GIS Analysis

Classified Point Cloud

- > Per ASPRS LAS specifications

Terrain

- > Digital Surface Model (Grid and TIN), Digital Elevation Model, Ground contours

Vegetation Extents, Individual Trees

- > Location, Elevation, Height, Radius

Structures

- > Location, Perimeter Vectors, Roof Facets

Power Lines

- > Power Line Vectors, Power Pole Locations, Power Line Attachment Points

Results of LiDAR Processing Methods: Populating your GIS Using ArcGIS 10.1

Classified Point Cloud

- > Per ASPRS LAS specifications

Terrain

- > Digital Surface Model (Grid and TIN), Digital Elevation Model, Ground contours

Vegetation Extents, Individual Trees

- > Location, Elevation, Height, Radius

Structures

- > Location, Perimeter Vectors, Roof Facets

Power Lines

- > Power Line Vectors, Power Pole Locations, Power Line Attachment Points

ArcGIS 10.1

Attributed Vectors

LiDAR for Forestry GIS

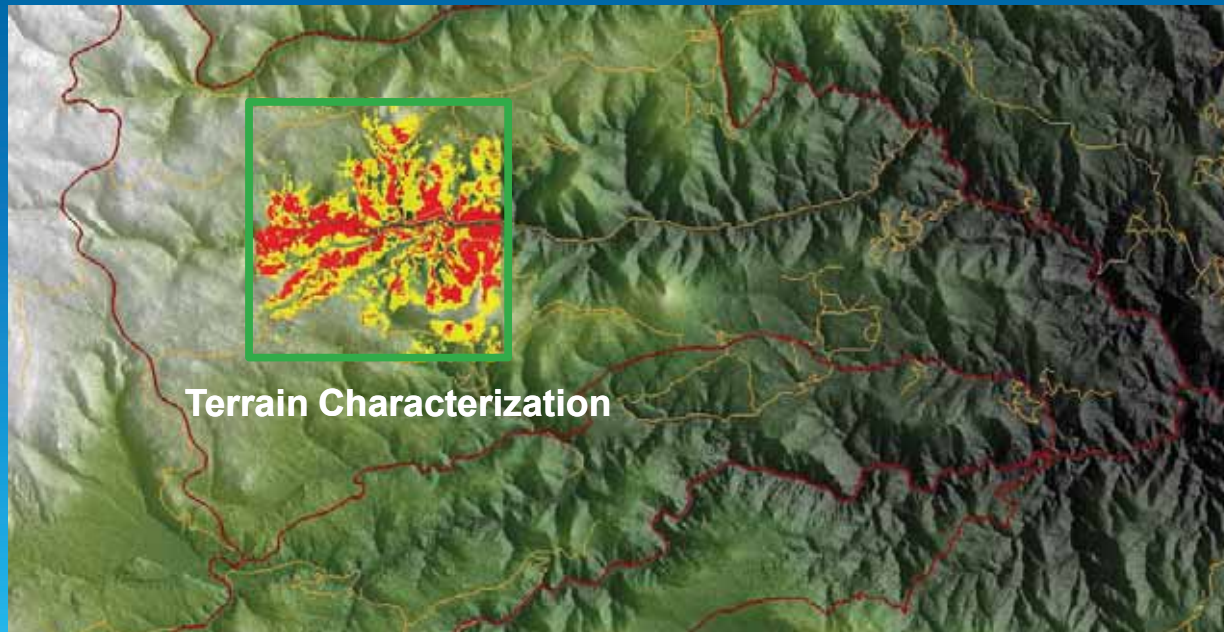

Visual Interpretation and Mensuration

LiDAR for Forestry GIS: Topography

Understand Terrain and Its Effects on Operations

- > Bare Earth DEMs for accurate foundational elevation
- > Surface models for feature delineation, elevations
- > Slope, aspect for mobility analysis, logistics
- > Hydro assessment, avoid flood-prone areas

LiDAR for Forestry GIS: Vegetation

Assess Forest Health; Calc Biomass; Inventory

- > Canopy Height Model for volumetric biomass estimates
- > Canopy density measures using classified points
- > Tree counts and locations
- > Species identification?

DSM

DEM

Feature Height Model

LiDAR for Forestry GIS: Encroachments

Identify Operational Risks and Liabilities

- > Extraction of individual tree/structure features
- > Above ground utility line delineations
- > Access Road blockages

Integrating LiDAR Information into GIS: Multi-dimensional Decision Support
