Abstract

Phat Functionality in a Thin Client: Advanced ArcIMS/ColdFusion Development
Track: Application Development
Author(s): Jason Harris

Utilizing ColdFusion's powerful database connectivity, XML parsing, and scripting tools, you as a developer can create advanced Java-like functionality in a thin Web client. This paper will focus on using advanced ColdFusion techniques in conjunction with the mapping capabilities of ArcIMS to create Web applications that emulate many "fat clients." Topics ranging from saving projects online, drawing tools, user defined dynamic layers, on-the-fly layer rendering, and on-the-fly DXF/DWG conversion will be covered.
