Abstract

ArcPad and Field Data Collection at the City of Garland, TX
Track: State and Local Government
Author(s): William Langley

ArcPad applications for field data collection have proven helpful and profitable for the City of Garland, Texas. Garland's Geographic Information Systems Department worked with the City's internal consulting group, the Organizational Development Team (ODT), to develop a neighborhood survey using an ArcPad software-based field data collection system. This opened the door for the same system to be used for other field GIS requirements. The City's Solid Waste and Recycling department has benefited from this system, as has the Health and Housing departments. This presentation will include a description of these ArcPad software-based field computing projects, the problems solved, and lessons learned.
