Abstract

Providing GIS to Non-GIS (Police and Security) Users with ArcObjects

Track: Law Enforcement and Criminal Justice

Author(s): Paul Pan, Steve Cobb

This paper discusses the provision of GIS to non-GIS users. Intelligence plays a vital role in combating not only international terrorism but also domestic crimes. In order to explore the full potential of the intelligence materials available, GIS technology shall be made more accessible to non-GIS users, such as frontline police officers and other law enforcement agents. A standalone police/security application is currently being developed for a consortium of police departments and other agencies in the United Kingdom using ArcObjects and MapControl. Potential applications include the development of a full range of task-specific custom-built software modules.
