Abstract

Development of a Parks Inventory/Maintenance Application Using ArcPad
Track: Application Development
Author(s): Sarah Van Wormer, Linn Kracht

The Parks and Recreation Department, in conjunction with Public Works (Field Services) and GIS, is transitioning from a manual maintenance/inventory data collection to an automated application (PAM–Park Asset Management). Time constraints and a resource deficit significantly impede park management. This paper explores a mobile and geospatial solution for efficiently managing parks. ArcPad running on a Compaq iPAQ has enabled park management to go mobile and digital, thus diminishing the time and resources required.
