Abstract

Municipal GIS: Custom ArcIMS Intranet Applications Make GIS More Accessible
Track: State and Local Government
Author(s): Carol McCoy, Matthew Tapp, Linda Beets

ArcGIS provides a robust set of tools for creating and maintaining spatial data. While these tools offer exceptional functionality, they can be very daunting to a user unfamiliar with the concepts associated with this technology. The majority of GIS users only need to navigate through a map and do not use the more sophisticated tools that allow advanced users to create and edit. The City of Olathe, Kansas has developed customized applications on the intranet for city staff. These applications, powered by ArcIMS, support specific tasks that city employees perform on a daily basis.
