Abstract

Going Digital: The New Recruits at Land Records Offices
Track: Cadastral and Land Records
Author(s): David Finney

The paper will describe how the newest recruits at land records offices--digital technologies--make accessing land information both a satisfying and empowering experience for today's citizen. Using the Internet, citizens can access land information or apply for permits within the comfort of their own homes. Likewise, the flow of land information back to local government offices from its employees in the field is also benefiting from advances in technology. Personal Digital Assistants (PDA), pen computers, and Interactive Voice Recognition (IVR) software are speeding the transmission and improving the accuracy of information flowing from the field to the office.
