ARMY ITAMGIS: Providing Standard GIS Services Through Centralized Support
Track: Defense and Intelligence
Author(s): Jason Walters, Paul Dubois

The Integrated Training Area Management (ITAM) Program is a land management program that supports Army training, and hence, relies heavily upon standard GIS capabilities at each of its 125 training sites. ITAM GIS capabilities support Army training through services including the support in planning of individual training events, vegetative land cover change analysis, custom map production, and application development. Large ITAM installations have a workload that requires a GIS analyst onsite; however, small installations have neither the workload nor the budget to warrant onsite GIS support. To provide GIS services to these sites, the two ITAM GIS Regional Support Centers provide centralized support. The Western RSC is located in Fort Collins, Colorado and serves the western United States and Korea; the Eastern RSC is located at Fort A.P. Hill, Virginia, and serves the eastern United States and Germany.
