Abstract

**Habitat Information Systems for Endangered Species Recovery Planning**

**Track:** Ecology, Archaeology, and Conservation  
**Author(s):** Scott Phillips, Laurie Williams, Brian Cypher

We are using geographic information systems and remote sensing to build a spatial database of habitat characteristics of lands supporting upland species in the San Joaquin Valley, California. This will be used as tool in the implementation of a multi-species recovery plan for the region. The database will be used to access habitat quality, connectivity, and landscape characteristics.
