Abstract

Geodatabase Models for Stormwater Studies
Track: Water, Wastewater, and Stormwater
Author(s): Jim Trimble, Kathleen Nuckolls

A water resources geodatabase model provides a very efficient and effective means to manage stormwater studies. This presentation will show how a geodatabase model for a stormwater system is used to drive hydrologic and hydraulic modeling. An overview of the steps required to build and use the geodatabase to carry out the steps of the stormwater study process will be shown. Additionally, ways that the resultant geodatabase provides a powerful tool for the client to manage and maintain their stormwater infrastructure will be discussed.
