Abstract

Shell's Regional Enterprise GIS for North West Europe
Track: Petroleum
Author(s): Thierry Gregorius

In Shell, GIS is largely credited with enabling co-operation across organizational boundaries by virtue of its spatial "glue." Shell Exploration and Production is regionalizing its businesses to maximize operational synergies within areas such as North West Europe. In this context ArcGIS and ArcIMS are playing a vital part in driving virtual teamwork across national borders. A common spatial architecture delivering standardized map services and layer files has been developed on Oracle Spatial and ArcSDE, integrated with online data portals and document management systems. Users can now access, share, create, and archive geographic information irrespective of location across Europe.
