Abstract

Extension and Management Issues in Watershed Project Implementation
Track: Agriculture
Author(s): Purushottam Verma

Watershed development is an area of development approach for integrated and sustainable development of agriculture and allied activities. These issues act as a central point of discussion between water consumers at the field level and policy makers at the local water authority offices. These issues affect the implementation process of the project. The paper presents extension and management issues realized in the implementation of a Dandeswar watershed project located in district of Almora in Uttaranchal, India. These issues delay the project implementation and technology adoption. The issues are in relation to socio-economics, technologies, policy and program of the project. The paper concludes that socio-economic and management issues are more important and should be taken care of before watershed project implementation.
