Abstract

Impact Assessment Analysis of the Environmental and Social Effects on the Salonga National Park
Track: Education
Author(s): Megan Virgili

Africa's largest tropical rainforest reserve, the Salonga National Park, is the habitat of many endemic endangered species. There are currently no published geographic maps or impact analyses of the Salonga National Park, making it difficult to implement a management plan. There are several human threats imposing on the natural habitat of species, including numerous endangered species living inside the park. These threats relate to activities including illegal timber extraction, poaching, natural resource extraction, and illegal cultivation. It is necessary to create a vegetation map, a base map, and various analysis maps in order to assist in the implementation of a management plan for the Salonga National Park and to keep the habitat and species of the park protected.
