

Modeling Urban Sprawl: from Raw TIGER Data with GIS

Brady Foust

University of Wisconsin-Eau Claire

Lisa Theo

University of Wisconsin-Stevens Point

Problem

- **How to model & predict urban expansion.**
- **Plan for:**
 - **City services.**
 - **Schools.**
 - **Traffic flows.**

Traditional Methods

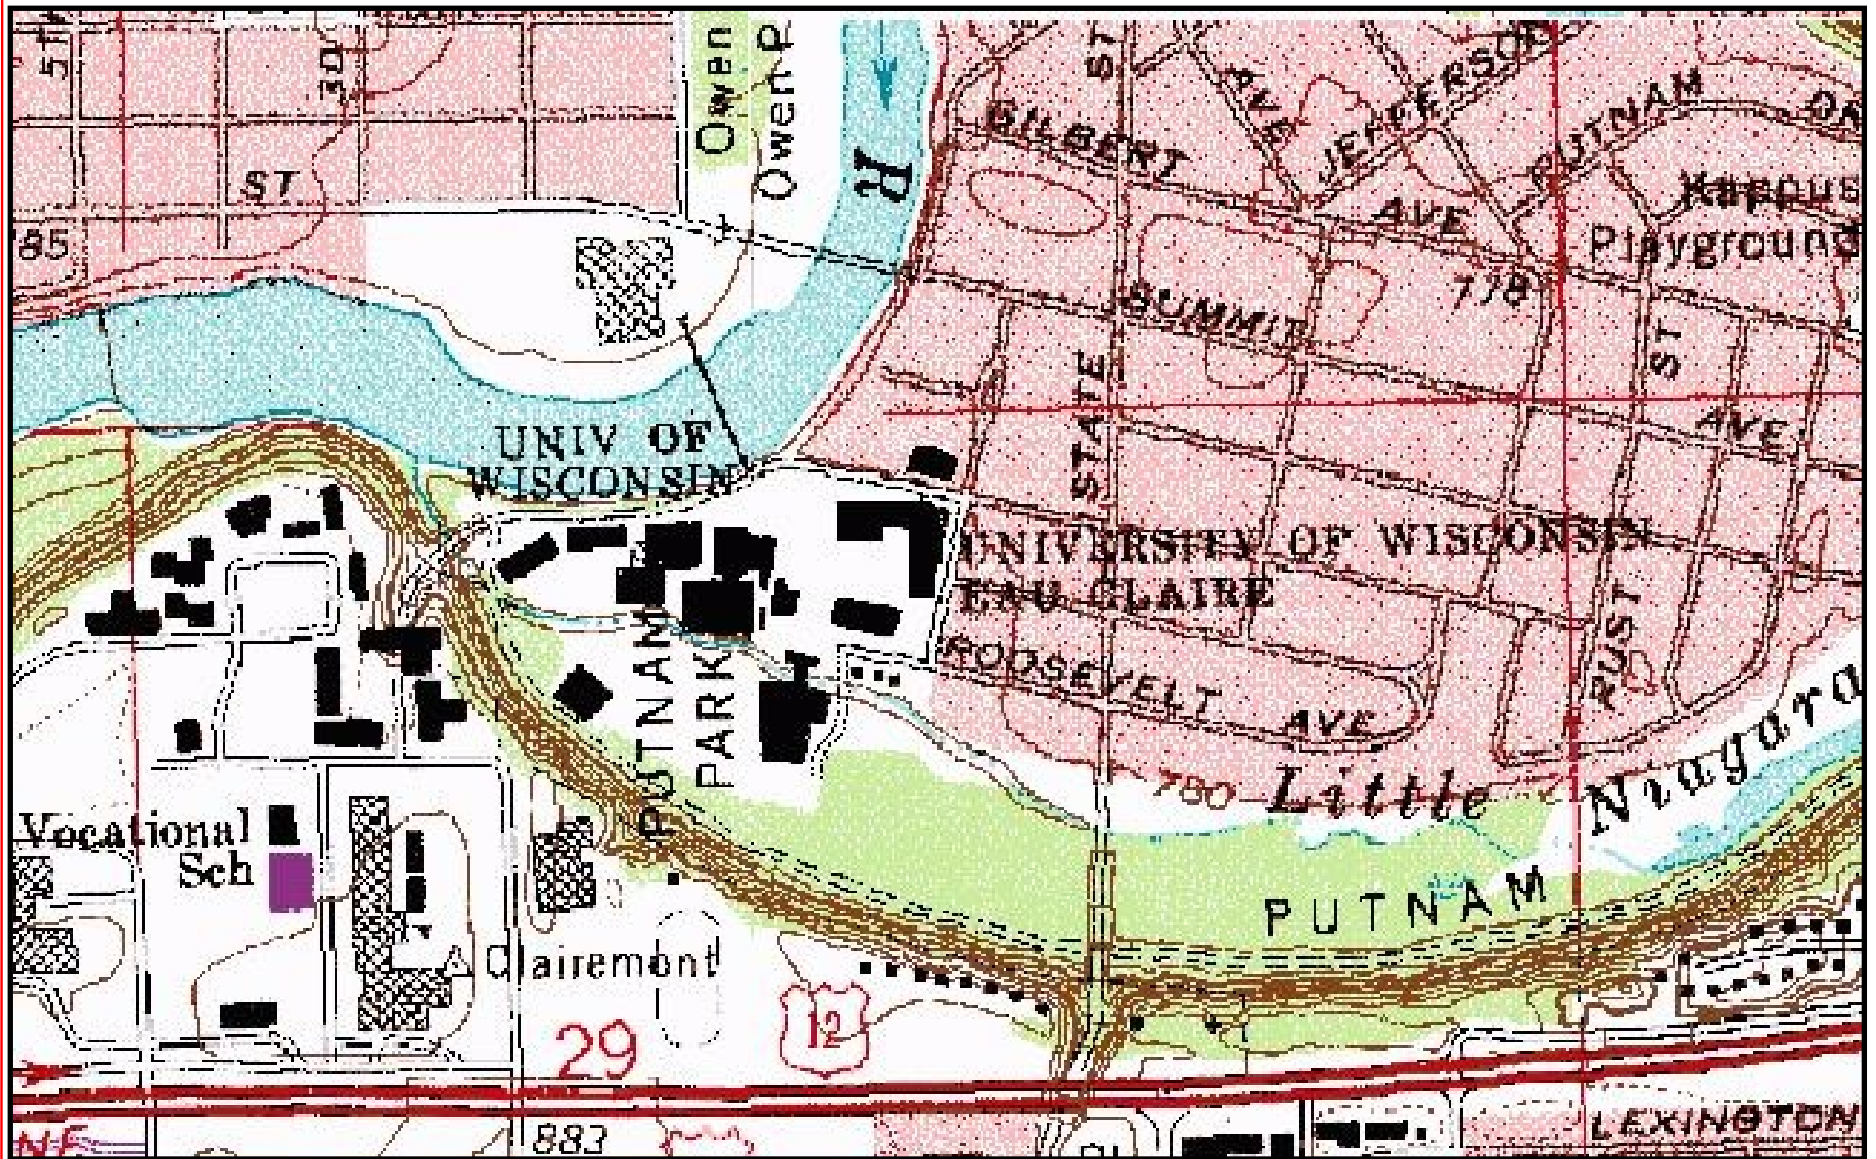

- **Population density.**
- **Building density.**
- **Building permits.**
- **Utility hookups.**
- **All are difficult and expensive to collect.**
- **Hard to construct a time sequence.**
- **Most are “near real time”.**

Borchert's Methodology

- Borchert, John “The Twin Cities Urbanized Area: Past, Present, Future”, *Geographical Review*, Vol. 51, No. 1 (January 1961), pp. 47-70.
- Counted street intersections per square mile off 7.5” topographic sheets.
- Key idea = development follows roads.
- Problems:
 - Sheets can be old.
 - Adjacent sheets published at different times.

This Paper

- **Examines the use of raw Bureau of the Census TIGER data to model urban sprawl.**
- **Thesis:**
- **Network density is an excellent way to anticipate urban infilling.**
- **Annual updates of TIGER provide historical data that can be projected ahead using geostatistical analysis**

TIGER

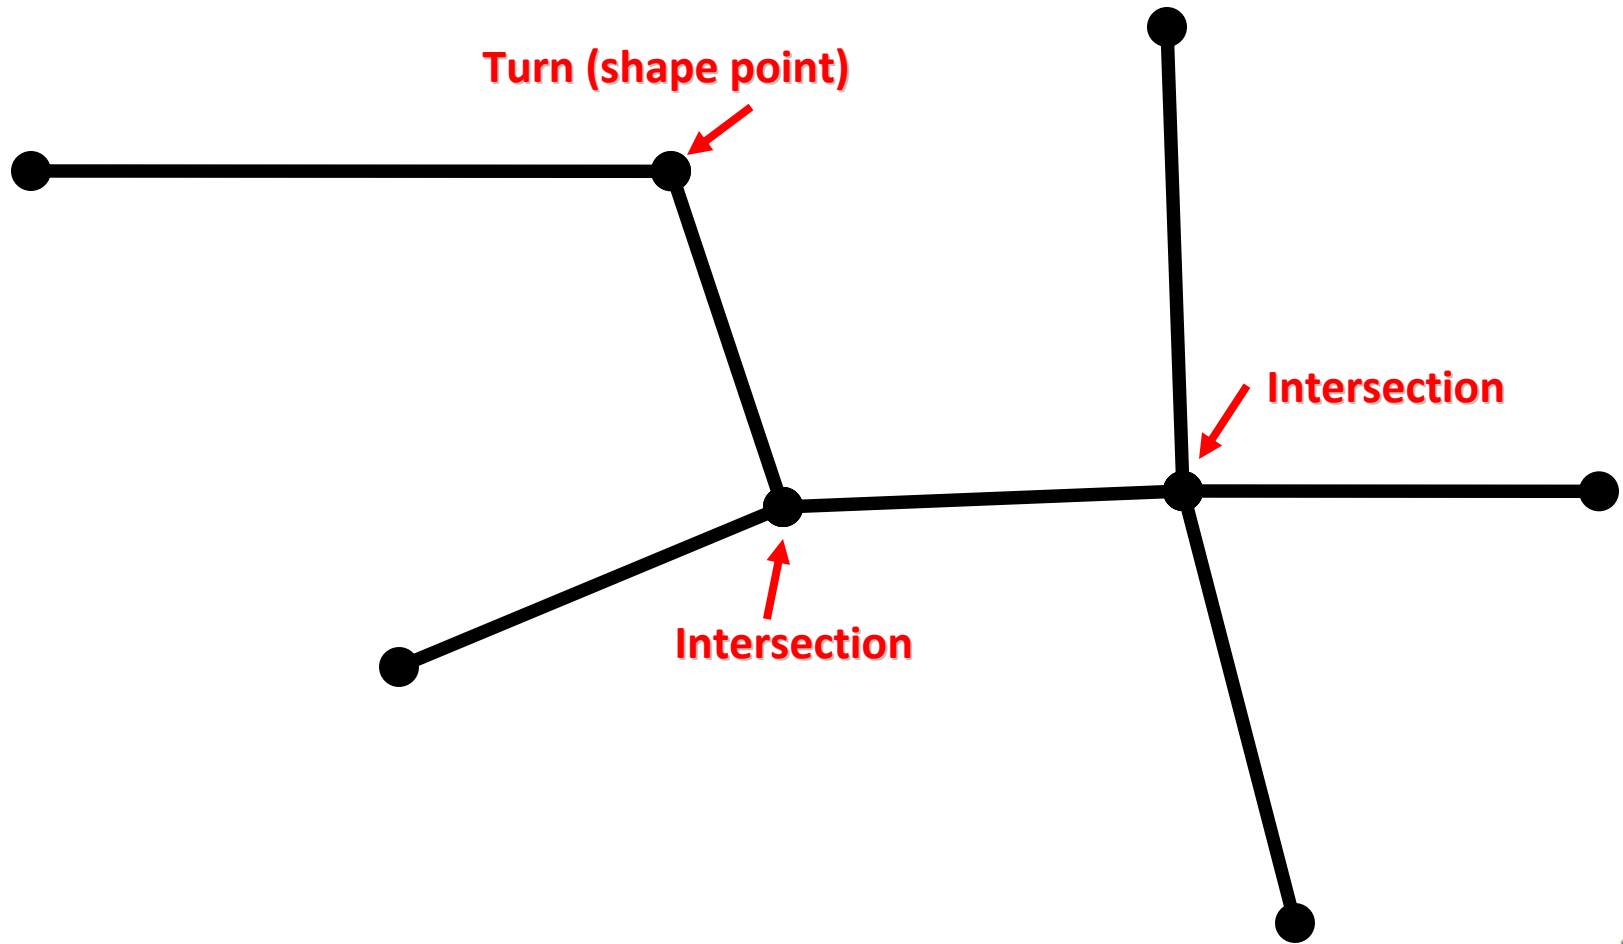

- **Now released at least annually.**
- **Constant updating (positional accuracy).**
- **Constant updating (new roads/streets).**
- **Provides basis for determining intersections per square mile.**

TIGER Basics

- **File of nodes.**
- **Create lines and polygons with “connect the dots” routines using underlying database.**
- **Intersections = multiple nodes in same location.**

Intersection "Rules"

- **Must be a street node (feature)**
- **Three or more street nodes with same location (lat/lon) = intersection.**
- **Grid for calculating intersections per square mile must be clipped with water features.**

Raw TIGER

- **Drop base file into dBase.**
- **Delete all non-street features.**
- **Concatenate lat/lon (alpha).**
- **Convert lat/lon to text (LATLON).**
- **Concatenate.**
- **Total on LATLON to new file.**
- **Delete any record where count < 3.**
- **De-concatenate LATLON to two numeric fields.**
- **Create event layer.**

Intersections Eau Claire, WI Metropolitan Area

Each dot =
1 intersection

Intersections per Square Mile

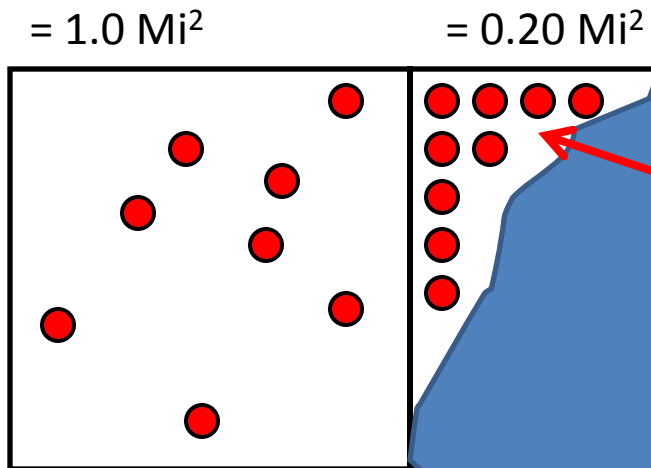

- **Generate grid (1 mile, ¼ mile, etc.)**
- **Spatial join to obtain per cell count.**
- **Problem – have to clip grid where housing is impossible (lake, river, ocean).**

Each cell = one square mile.
Each cell has 64 intersections.
Intersection density = 64 per square mile

8 intersections
per MI²

40 intersections
per MI²

Intersections Eau Claire, WI Metropolitan Area

Each dot =
1 intersection

TIGER Intersections per Square Mile

1 Mile Grid Categories

TIGER

- **Now released at least annually.**
- **Constant updating (positional accuracy).**
- **Constant updating (new roads/streets).**
- **Provides basis for determining intersections per square mile.**

Census

- **Decision to release TIGER in shapefile format.**
- **Shapefiles = defacto standard.**
- **“What everyone wants”.**
- **No plans to release raw TIGER data any longer.**
- **Intersections not easily obtained.**

What now?

- **Improvisation = key GIS skill.**
- **Could convert line file to nodes using ArcInfo routine.**
- **Roads may be a better predictor of sprawl than simple intersections.**

Intersections = 0

Intersections = 2
