

Esri International User Conference | San Diego, CA
Technical Workshops | July 12th and 13th, 2011

ArcGIS Network Analyst – An Introduction

Patrick Stevens

Robert Garrity

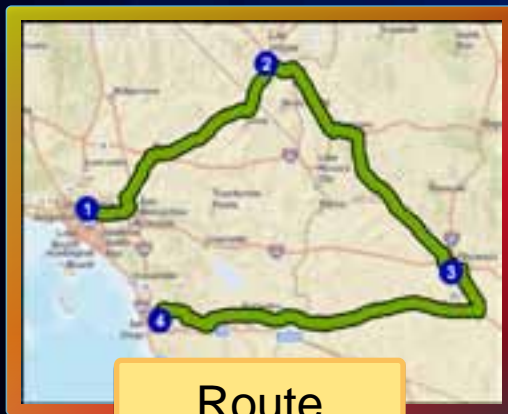

Demo: Example applications

Introduction to Network Analyst

- **What is Network Analyst?**
- **Powerful modeling capabilities of the network dataset**
- **Analysis demos**
- **Network Analyst at the User's Conference**

Route

Closest Facility

Service Area

ArcGIS Network Analyst Extension

Solving transportation problems

Location-Allocation

Vehicle Routing Problem

Origin-Destination Cost Matrix

How you work with Network Analyst

- **Enable extension license**
- **Work with Network Datasets**
 - ArcMap
 - ArcCatalog (or ArcMap's Catalog window)
- **Perform network analysis**
 - ArcMap
 - Geoprocessing
 - ArcGIS Explorer
 - ArcGIS Server
 - ArcScene/ArcGlobe
 - ArcGIS Online

ArcGIS Network Analyst Extension
Solving transportation problems

Network Analyst controls in ArcMap

Network Analyst Toolbar

- New Route
- New Service Area
- New Closest Facility
- New OD Cost Matrix
- New Vehicle Routing Problem
- New Location-Allocation
- Options...

ArcToolbox

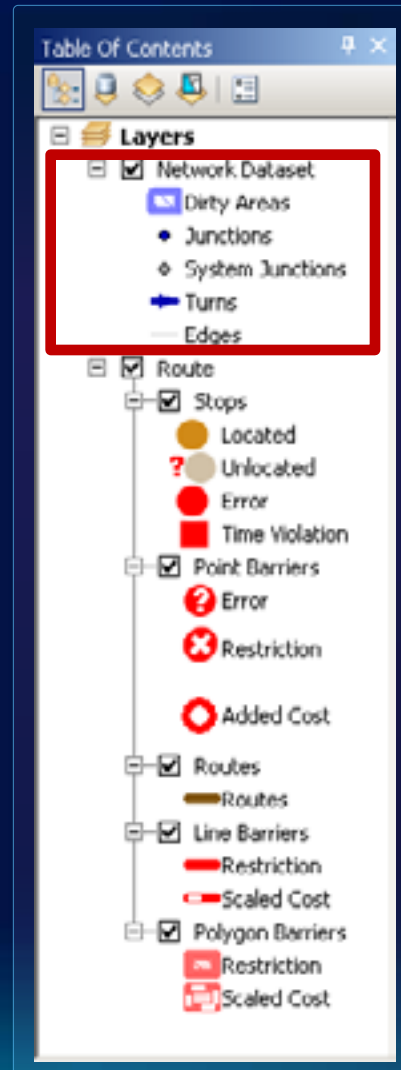

Network Analyst Tools

- Analysis
 - Add Field to Analysis Layer
 - Add Locations
 - Calculate Locations
 - Directions
 - Make Closest Facility Layer
 - Make Location-Allocation Layer
 - Make OD Cost Matrix Layer
 - Make Route Layer
 - Make Service Area Layer
 - Make Vehicle Routing Problem Layer
 - Solve
 - Update Analysis Layer Attribute Parameter
- Network Dataset
 - Build Network
 - Dissolve Network
 - Upgrade Network
- Turn Feature Class
 - Create Turn Feature Class
 - Increase Maximum Edges
 - Populate Alternate ID Fields
 - Turn Table To Turn Feature Class
 - Update by Alternate ID Fields
 - Update by Geometry

Geoprocessing Tools

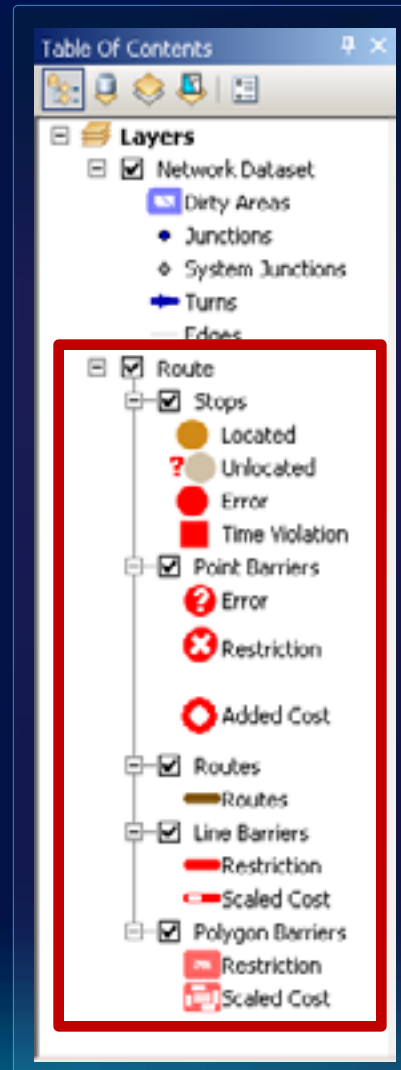

Specialized layers

A **Network Layer** holds a reference to a network dataset.

Specialized layers

A **Network Analysis Layer** is a composite layer configured for a specific solver.

Demo: Start working with Network Analyst

Modeling Street Networks with Network Datasets

Where do you get street data?

- **Free data**
 - Data and Maps DVD
 - TIGER
 - ArcGIS Online

- **Community data**
 - OpenStreetMap

- **Your data**

- **Vendor data**

Euclidean vs. Network Path

Connectivity

- How streets connect

Cost Attributes

- Model network cost, such as distance or travel time

1 mile

1.2 minutes (driving)

Demo: Start working with network datasets

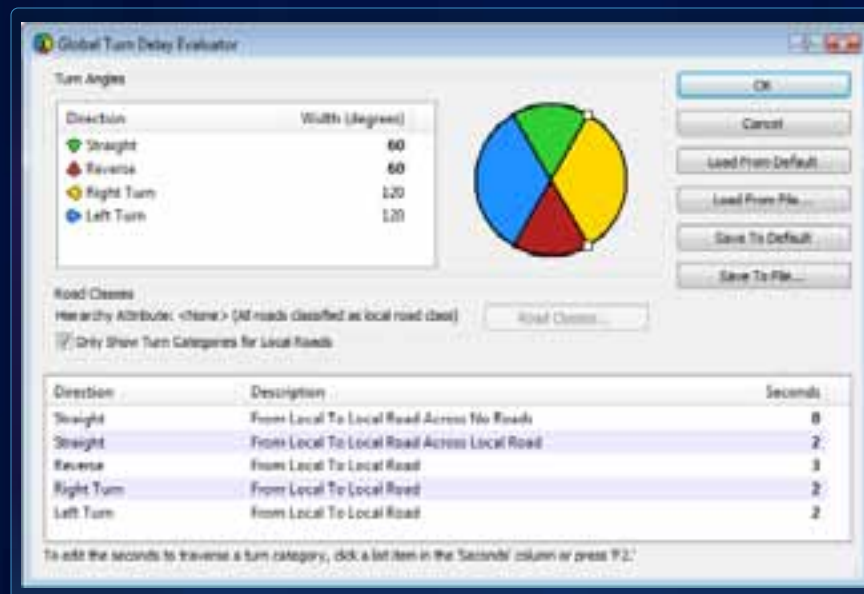

Cost Attributes

- Turn Delays
 - Add cost to a specific turn

Cost Attributes

- **Global Turn Delays**
 - Add a cost to every turn in the network.
 - Reduce the number of turn features you need to digitize.

Cost Attributes

- **Historical Traffic**
 - Find the best routes given expected traffic delays.
 - Get more accurate arrival times.

Restriction Attributes

- Specify which edges, junctions, and turns can't be traversed

Restriction and Descriptor Attributes

- **Restriction attributes can be derived from descriptor attributes and vehicle characteristics**
 - **Model height, weight, width limits**

Demo: Modeling street networks

Dynamic Modeling

U-Turn policy

- **Sometimes the shortest route includes a U-turn**
- **Restrict U-turns if...**
 - **you prefer not to make them**
 - **it's difficult to make them with the vehicle you're driving**

Restriction Barriers

- Model temporary restrictions like...

**Natural
disasters**

Parades

**Territory
boundaries**

Road closures

Scaled-Cost Barriers

- **Barriers that model temporary slowdowns like...**
 - **Inclement Weather**
 - **Construction**

Curb Approach

- **Curb approach ensures the vehicle arrives on and departs from a specific side of the road.**

Demo: Dynamic modeling

Solvers

Route solver

- Find the best route that minimizes travel cost through a series of stops
- Variations
 - Time windows
 - Find best sequence
 - Directions
 - Start time

Closest facility solver

- Finds the best routes and directions to the nearest facilities from each incident
- Variations
 - Cutoff value
 - Number of facilities to find
 - Direction of travel

Demo: Dispatching

Find the nearest emergency vehicle to an incident

Fire Truck #1	Idle
Fire Truck #2	Idle
Fire Truck #3	Responding
Fire Truck #4	Responding
Fire Truck #5	Responding
Fire Truck #6	Idle
Fire Truck #7	Idle

Demo: Dispatching – takeaways

- **Use the Closest Facility solver to route groups of vehicles to a location.**
- **Solvers work fast enough to reroute moving vehicles.**
- **Network Analyst can easily be used as a web service.**
- **All Network Analyst capabilities are available via ArcGIS Server.**

Service area solver

- Find areas you can reach from one or more locations
- Variations
 - Multiple break values
 - Direction of travel
 - Overlapping versus non-overlapping areas
 - Output lines or polygons

Demo: Fire coverage

Visualize deficient fire coverage

Demo: Fire Coverage - takeaways

- **Determine your problem type, and pick the most appropriate solver.**
- **The Service Area solver provides a tool that shows street coverage areas that are easily visualized.**

Location-Allocation solver

- **Determine the best location for a facility, based on demand conditions**
- **Analysis Types**
 - Minimize Impedance
 - Maximize Coverage
 - Minimize Facilities
 - Maximize Attendance
 - Maximize Market Share
 - Target Market Share

Demo: Locating Fire Stations

Find the optimal location for a new fire station

Demo: Locating Fire Stations - takeaways

- **When the problem type is locating facilities, Location-Allocation is the most appropriate solver.**
- **Location-Allocation offers many different analysis types appropriate for different situations.**

Vehicle routing problem (VRP) solver

- **Route a fleet of vehicles**

- **Variations**

- Capacities
- Driver Specialties
- Work Breaks
- Time Windows

Demo: Appliance Delivery

Create optimal routes for four vehicles to deliver appliances to many customers

Demo: Appliance Delivery - takeaways

- **Route a fleet a vehicles using the vehicle routing problem solver.**
- **Time windows, capacities, breaks, and other constraints make it a flexible modeling tool.**
- **Note: ArcLogistics is a VRP-based product geared for non-GIS professionals.**

Vehicle Routing Problem

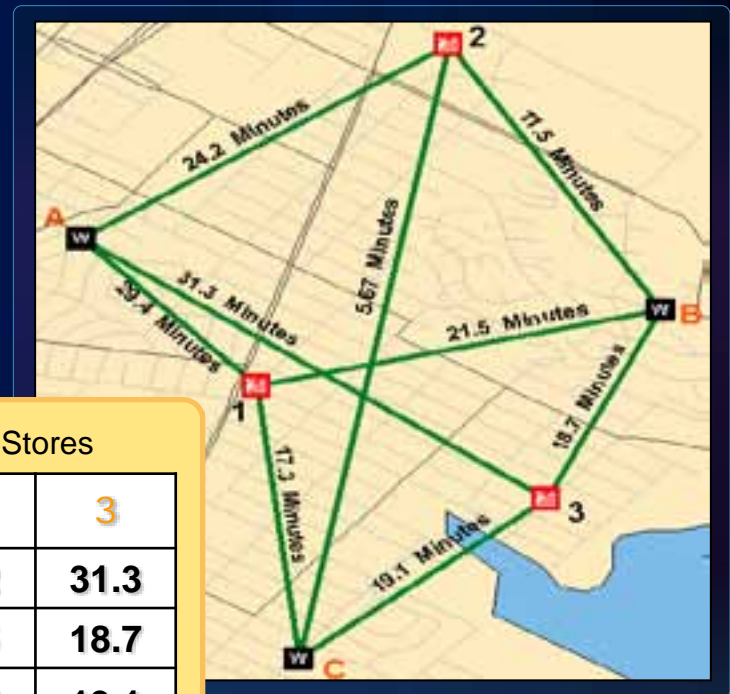

Origin-Destination Cost Matrix

Origin-destination cost matrix solver

- Generates a matrix of the travel costs from origins to destinations
- Variations
 - Cutoff value
 - Number of destinations

Origins - Warehouses	Destinations - Stores		
	1	2	3
A	29.4	24.2	31.3
B	21.5	11.5	18.7
C	17.3	5.67	19.1

Demo: OD Cost Matrix

Find the distances between all of the capital cities in the United States

A screenshot of a large data table, likely an Excel spreadsheet, showing the results of an OD Cost Matrix calculation. The table has many columns and rows, with numerical values representing distances between various locations. The data is organized in a grid format, with each row and column representing a different location.

Demo: OD Cost Matrix – takeaways

- **Origin-Destination Cost Matrix solver takes two sets of input locations and produces a table of cost distances.**
- **Use OD when output geometry is not important. Use Closest Facility when it is.**

Benefits of Network Analyst

- **Use an accurate model of a transportation network**
- **Quickly and easy solve complex problems**
- **Save your company money**
 - **Shorter routes means less gas, less maintenance, less driver overtime, more customers serviced**
 - **Find the optimal locations for facilities or remove redundant facilities**
- **Used across ArcGIS**

Common Questions

- Does Network Analyst support Arc routing (high-density routing)?
- Can I get alternate shortest paths?
- How do I analyze my utility or natural resource networks?
- Can Network Analyst work with transit schedules?

The road ahead (10.1)

- **All solvers will be time aware**
- **Real-time traffic**
- **Faster service area**
- **Geoprocessing improvements**
 - **arcpy.na site package**
 - **Copy traversal result tool**
 - **Simpler publishing story (SA and VRP)**
- **Speed improvements**
