

Esri International User Conference | San Diego, CA
Technical Workshops | Thursday, July 07, 2011

Designing and Using Cached Map Services

Eric Rodenberg & Tom Shippee

What we will cover

- Session Topics

- Map cache basics
- Map cache workflows
- Cache as a raster dataset
- Caching imagery

Please!
Turn **OFF** cell phones
and paging devices

We will answer questions at the end of the session

Why should I care about map caches?

- Performance, performance, performance
- Scalability: Industry standard
- Cartographic quality

- [ArcGIS Explorer Online](#)

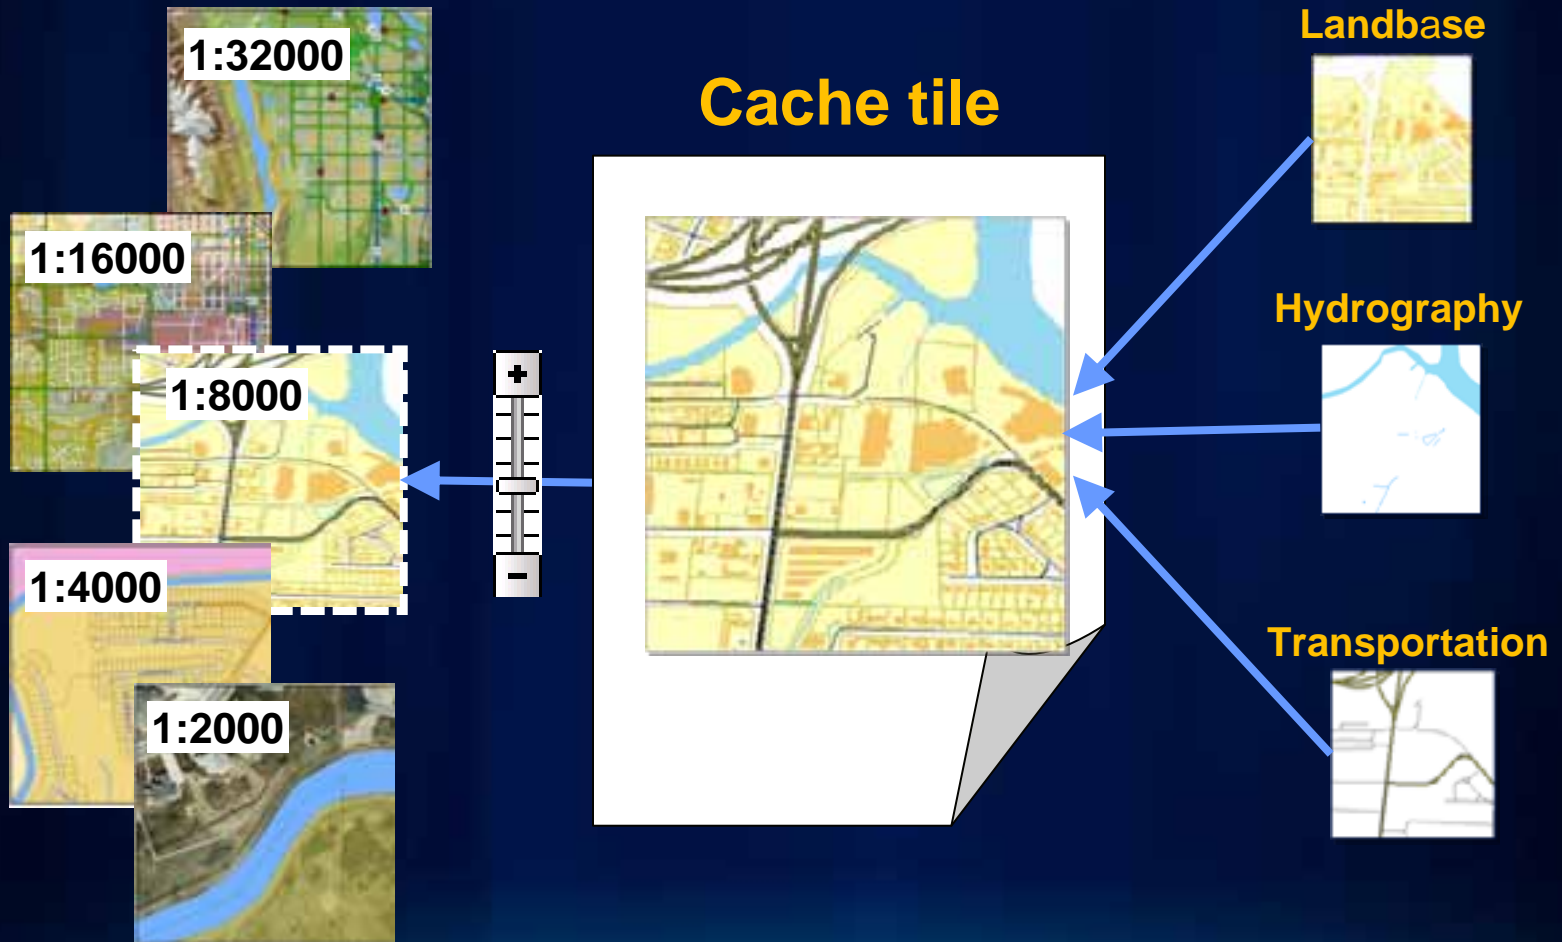

DeKalb County Board

Fulton County Dept. of Health and Wellness/District 3, Unit 2, 04

Map cache basics

What is a map cache?

How does a map cache work?

Users expect map cache speed & quality

10 years ago

- Dynamic drawing
- Slow to render
- Compromised cartography

Today

- Cached maps
- Fast response
- Enhanced cartography

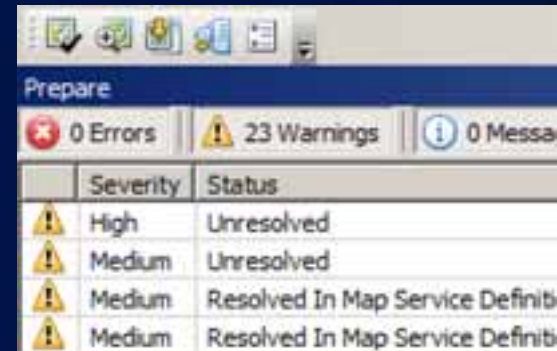

What should you cache?

- **Base maps (always)**
- **Operational layers that satisfy one of the following:**
 - High volumes of traffic
 - Don't change often
 - Cover small scales only

What about optimized map services?

- **Optimized drawing format**
 - Based on MSD file
 - Enhanced map drawing engine
 - Use to generated map tiles faster
- **Does NOT replace cache map service**
 - Requires dynamic rendering
 - Web services are optimized for cached tiles

	Severity	Status
⚠	High	Unresolved
⚠	Medium	Unresolved
⚠	Medium	Resolved In Map Service Definit
⚠	Medium	Resolved In Map Service Definit

Map cache workflow

Building a map cache

1 Choosing coordinate system and scales

- ArcGIS Online & Google Maps & Bing Maps
 - WGS 1984 Web Mercator (Auxiliary Sphere) coordinate system
- Create your own

Overlaying with ArcGIS Online

- **Project your map to WGS 1984 Web Mercator (Auxiliary Sphere)**
 - Recommended choice
 - Works in all clients
- **Project your map to WGS 1984 Web Mercator**
 - Datum transformations more difficult this way
 - Won't work in some clients (.NET ADF)

Creating your own scales

- **Build just the scales you need**
 - **Determine closest scale (Raster resolution)**
 - **Divide scale by 2 for each subsequent scale**
 - **Adjust smallest scale to full extent**

Sample 10 level cache

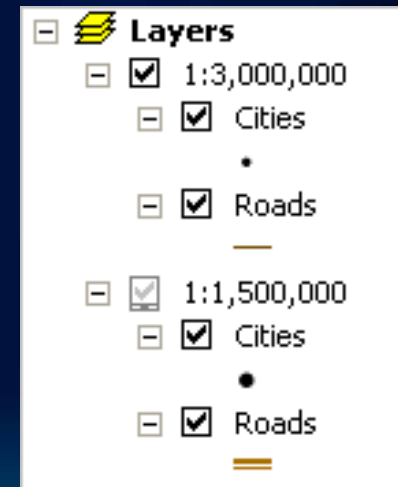

Level	Scale	Tiles	% of total
1	1:16,000,000	1	0.000%
2	1:8,000,000	4	0.001%
3	1:4,000,000	16	0.005%
4	1:2,000,000	64	0.018%
5	1:1,000,000	256	0.073%
6	1:500,000	1,024	0.293%
7	1:250,000	4,096	1.172%
8	1:125,000	16,384	4.688%
9	1:62,500	65,536	18.750%
10	1:31,250	262,144	75.000%

Final level is ~75% of the total

- **Consider ArcGIS Online scales**

2 Author the map

- **Design map for cache scales**
 - Add tiling scheme scales ArcMap
 - ArcGIS Online / Bing Maps / Google Maps available
 - Only display these scales when zooming
- **Group layers by scale level**
 - Only have to set the scale range at the group layer level
 - Copy layers between groups
- [ArcGIS Resource Center](#)

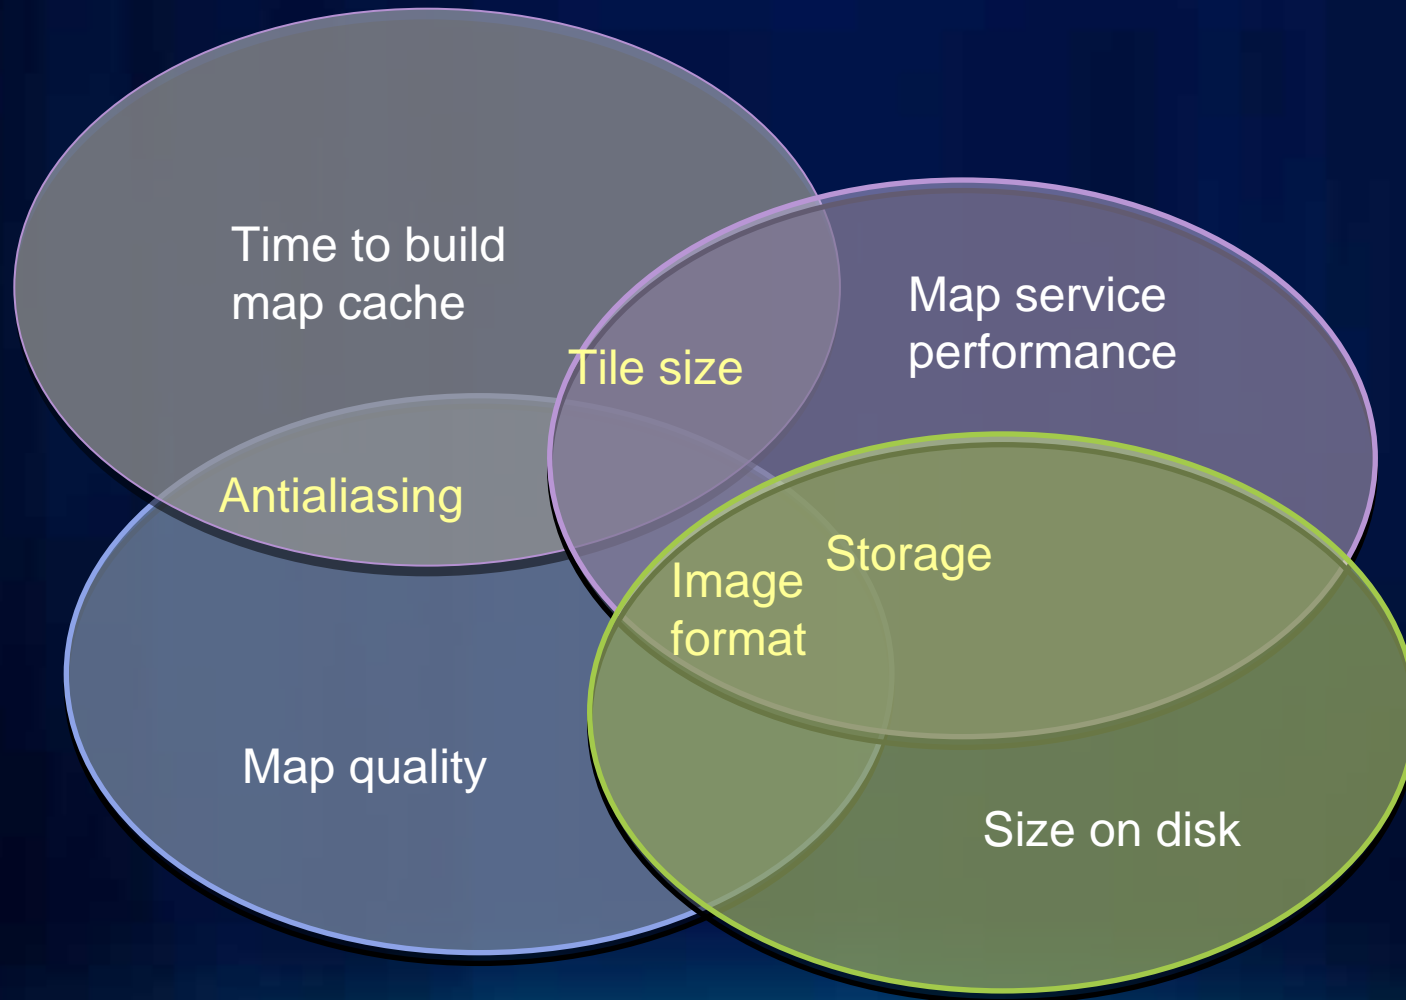

Authoring labels for the map

- Individual tiles are cut from large area (supertile)
 - 4096 x 4096
 - 2048 x 2048 if using antialiasing
- Supertile necessary to
 - Reduce duplicate labeling
 - Reduce requests to map service when caching
- Labeling rules can repeat across super tile boundaries
 - Maplex places better labels
 - Annotation

ArcGIS Online / Bing / Google

3 Setup cache properties

Tile size

- Pixel dimensions of each image
- 256x256 is the web standard
 - 512 X 512 : legacy ArcGIS Online
- Larger dimensions are faster to build, but tiles take longer to download

Choosing an image format

- **Image format effects**
 - Tile storage space requirements
 - Web application performance (speed and supported browsers)
 - Tile image quality and transparency
- **JPEG**
 - Great compression for many colors but not transparency
- **PNG**
 - Best compression for less colors
- **Mixed**

.JPG

.PNG

Comparing image formats

Output format	Transparency	Compression
JPEG	No	Lossy (groups <u>similar</u> cell values)
Mixed 		
PNG-32	Yes	Lossless (groups <u>same</u> cell values)

Mixed mode image format

- **Generates JPEG tiles unless transparent pixels detected**
- **If transparent pixels detected, creates PNG32**
- **Mashup basemaps with ArcGIS Online**
- **Mixed Mode Caches**

Two overlapping map services
Mixed mode cache on top of a JPEG cache

Operational layers: Image format guidelines

- **PNG 8**
 - Small size on disk + transparency support
 - Not for imagery
 - Use MSD-based service + heavy testing if over 256 colors
- **PNG 32**
 - Over 256 colors
 - Good for vector overlays with antialiasing
 - Caution: Large tile sizes
- **(PNG 24)**
 - Avoid in Web apps (poor IE 6 support)
- [Solar Boston](#)

Example: Tiles are too large

Aerial photo and
vector blend using
PNG 32

Console HTML CSS Script DOM Net					
Clear Persist All HTML CSS JS XHR Images Flash					
URL	Status	Domain	Size	Timeline	
GET 2637.png	200 OK		666.4 KB (?)		
GET 2638.png	200 OK		601 KB (?)		
GET 2637.png	200 OK		625.8 KB (?)		
GET 2638.png	200 OK		543.7 KB (?)		
4 requests			2.4 MB		

When should I use antialiasing

- High quality line and label appearance on vector maps
- Web standard (Google, Bing, AGOL)

- Optimized map services preferred for antialiasing (speed and appearance)

Choose storage format

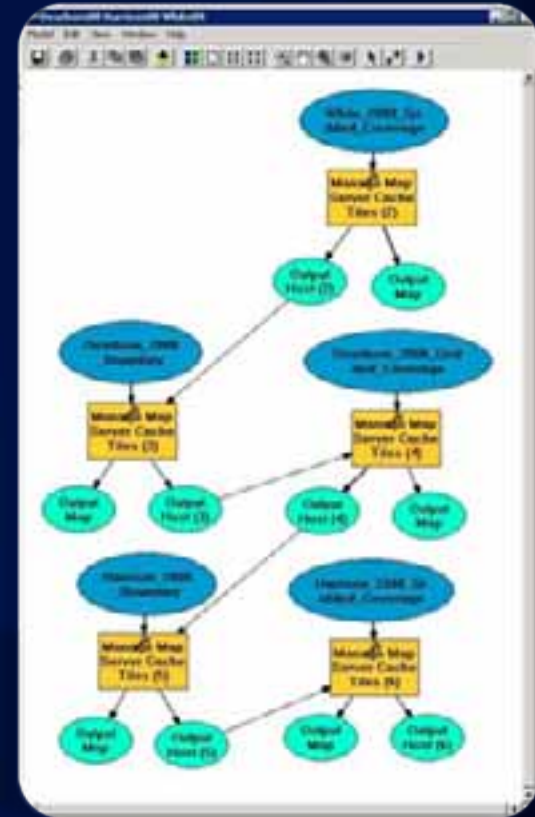

- **Compact**
 - Stores tiles in compact, continuous file streams (“bundles”)
 - Maximum ~16,000 tiles per bundle
 - Faster copying
 - Smaller size on disk
- **Exploded**
 - Tiles stored as individual images on disk
 - Can access with other tools
 - Marginally faster than compact
 - 5%-8% in most cases
 - Much larger on disk / difficult to manage

Type:	File Folder
Location:	C:\arcgisserver\arcgisocache
Size:	1.43 GB (1,540,992,470 bytes)
Size on disk:	1.43 GB (1,541,345,280 bytes)
Contents:	114 Files, 12 Folders

Type:	File Folder
Location:	C:\arcgisserver\arcgisocache
Size:	1.42 GB (1,530,965,075 bytes)
Size on disk:	2.22 GB (2,390,458,568 bytes)
Contents:	500,714 Files, 1,200 Folders

4 Generate Tiles

- **Manage Map Server Cache Tiles geoprocessing tool**
 - Almost always use this in a model
- **Allows spatial and scale constraints**
- **Can run multiple times to “target” creation of tiles**
 - All tiles at small scales
 - Most important tiles at large scales

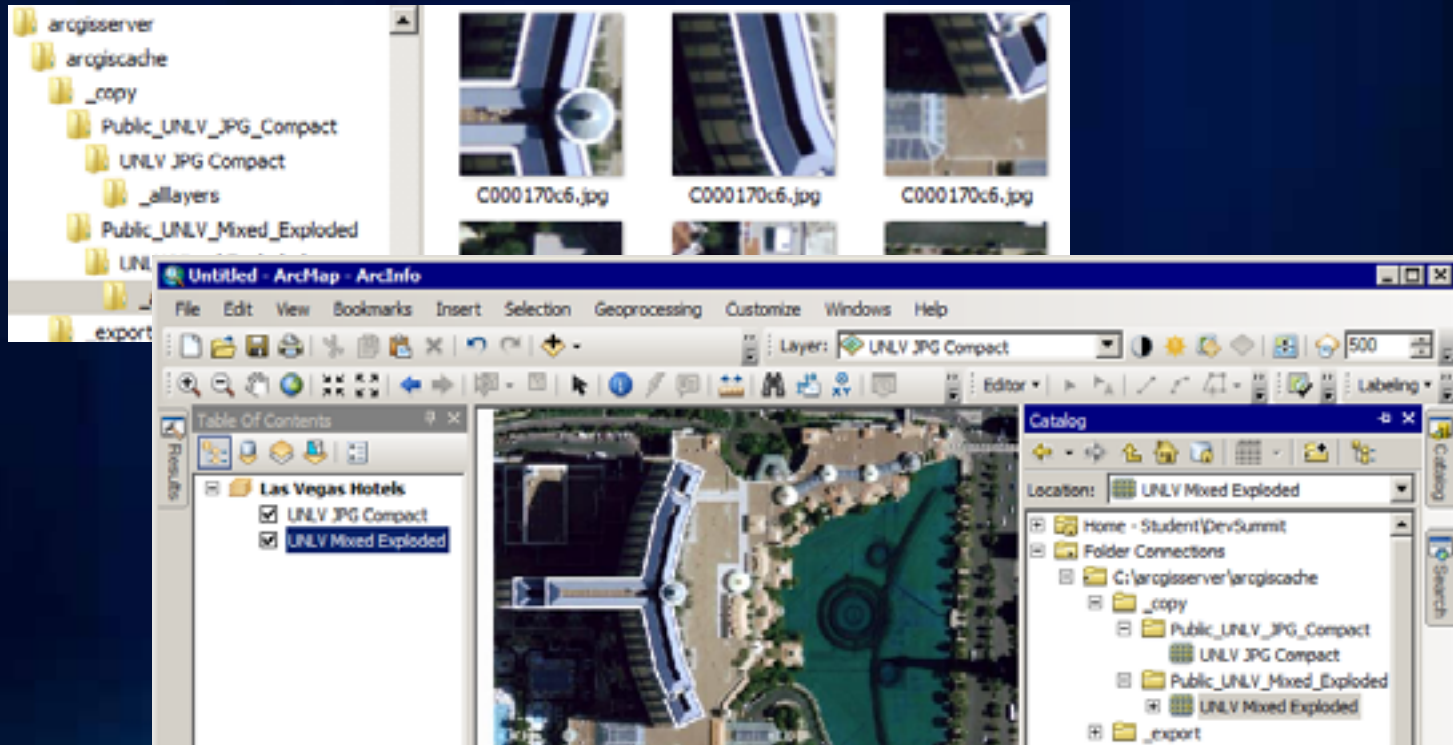

Cache as a raster dataset

Cache as a raster dataset in ArcGIS

- ArcGIS Desktop
- Disconnected field work (compact format recommended)
- ArcGIS Mobile (use cache in mobile project)

Cache export tool

- **Export tiles**
 - Based on extent or polygon features
 - Convert storage format
 - Use for cache import or as a disconnected cache

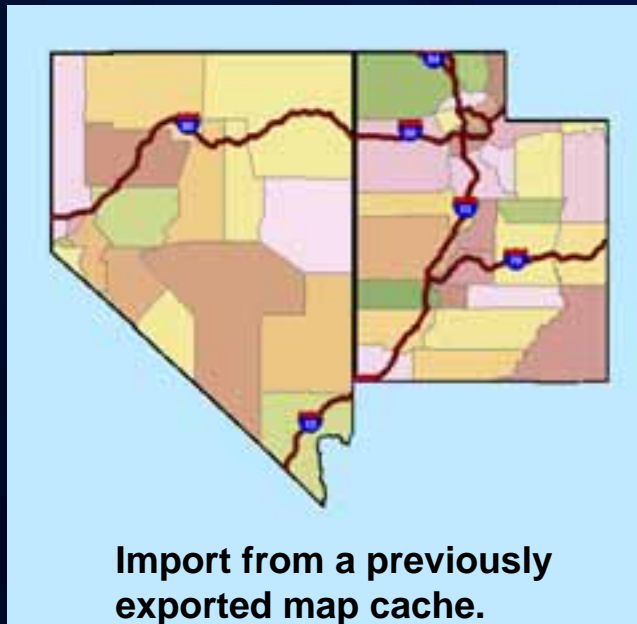

Export

Exported using Nevada and Utah state boundary features.

Cache import tool

- **Import tiles**
 - Based on extent or polygon features
 - Must have same storage format

Collaborative caching

- **Use export and import tools**
 - Import the “best available” cache content
 - Esri Community Base Maps program
 - **Session: Thursday, July 14 3:15 - 4:30 PM**
 - Building the Community Map: Technical Tips and Best Practices

Caching imagery

When should you cache imagery?

Cached map service

- Base map display
- Optimal performance
- Maximum scalability

Dynamic image service

- On the fly processing
- Exact extent returned
- Always up-to-date

Server Blog: [Should I use a map cache or image service?](#)

Cached imagery workflow

- **Prepare imagery**
 - Build raster pyramids
 - Create mosaic dataset with overviews
- **Author map document**
 - Add imagery to map
 - Save as MSD
- **Publish as a map service**
- **Create and manage the map cache**
 - Configure cache definition
 - Generate cache tiles
 - Update cached tiles

Image resolution and cache scales

- **Largest scale = raster resolution**
 - Zoom to raster resolution
 - Factors of 2 to full extent
- **Scale based on 96 DPI**
 - Scale (ft) = $(x/12) * 96$
 - Scale (m) = $(x/0.0254) * 96$

Cell size (m ft)		Scale 1:X
0.15	0.50	567
0.50	1.64	1,890
1.00	3.28	3,780
10.00	32.80	37,795
30.00	98.42	113,386
90.00	295.27	340,157
1,000.00	3,280.83	3,779,527

Choosing the best image format

- Large number of continuous colors
 - JPEG (start with quality = 55)
 - Mixed (if transparency required)

Which one looks better?

JPEG 96 – 25KB

JPEG 96 – 30KB

Using mixed mode for image overlay

JPEG = 3.06 MB

Disk space usage

PNG-32 = 19.3 MB

Transparency

Mixed = 6.07 MB

Best of both

Cache import for imagery

- Merge high resolution imagery into a base cache
- Seamless integration import feature boundary
