

Using ArcGIS and Python to Web-Enable USAPI Mapping System

2016 ESRI User Conference

Calvin Poulsen

National Drought Mitigation Center

USAPI

Introduction:

- The USAPI is an offshoot of the US Drought Monitor.
- It is expert driven weekly composite drought index for United States Affiliated Pacific Islands.
- It was developed to allow these islands to participate in the US drought relief programs that require USDM drought status.
- The original maps were developed by Richard Heim and he is still the only USDM author producing the USAPI.

USAPI

Continued:

- The original maps were not well balanced and had lots of extraneous information.
- I talked Richard into letting me automate the process.

National Drought Mitigation Center

The process

- The Dx levels are calculated, discussed and finalized for each island
- The Dx levels for each island is entered into the system and submitted.
- The system checks for new or changed entries and creates and emails maps for these entries.

Issues

- Richard wanted both monthly and weekly maps.
- Some islands would drop out of the based on data availability.
- Needed to be point based rather than area based.
- Needed to be accessible at anytime.

Solution

Move the entire operation to a web interface.

Adjust the MXD for all Island combinations.

Move the USAPI data to a separate database.

Add a Scheduled task that runs every 15 minutes.

The Web Interface

Time Scale

Weekly Monthly

The Database

The screenshot displays the SQL Server Enterprise Manager interface. On the left, the 'Object Explorer' pane shows the database structure for 'AD\cpoulsen2 (651)'. The 'Tables' folder is expanded, listing various tables such as 'dbo.dmAgencies', 'dbo.dmAuthors', 'dbo.domCountry', and 'dbo.USAPIstatus_weekly'. The main window shows an SQL query executed in 'SQL Query 1.sql'. The query is a 'SELECT TOP 1000' statement from the 'USAPIstatus_weekly' table, joined with 'dmReleaseID', 'domUSAPIID', 'domUSDMlevelsID', and 'domDroughtTypeID'. The 'Results' pane shows the output of the query, a table with 24 rows and 5 columns. The status bar at the bottom indicates 'Query executed successfully.'

```
SQL Query 1.sql - n...AD\cpoulsen2 (651)
/***** Script for SelectTopNRows command from SSMS *****/
SELECT TOP 1000 [domUSAPIstatus_weeklyID]
, [dmReleaseID]
, [domUSAPIID]
, [domUSDMlevelsID]
, [domDroughtTypeID]
FROM [USAPImapping].[dbo].[USAPIstatus_weekly]
```

	domUSAPIstatus_weeklyID	dmReleaseID	domUSAPIID	domUSDMlevelsID	domDroughtTypeID
1	1	827	1	7	4
2	2	827	2	8	4
3	3	827	3	8	4
4	4	827	4	8	4

Automation part 1

```
import pyodbc
import sys

# Import Custom Modules
sys.path.append("\\\\ndmc-005\\Production\\USAPI\\scripts\\IndividualShps")
sys.path.append("\\\\ndmc-005\\Production\\PYTHON\\email")

## NOTES
## This periodically checks the USAPI database for all mapdates that need to be processed
## It will run every 15 minutes 24hrs a day 7 days a week. It will email the resulting maps to R Heim
