

ArcGIS Integrations with Alexa and Salesforce

Overview:

- ▶ Alexa: What's near me?
- ▶ Salesforce Field Service Lightning: custom geofencing for work orders using ArcGIS REST API
- ▶ Salesforce: Integrating with ArcGIS API for JavaScript with Salesforce

Alexa, what is the radius of the earth?

BRIAN YARSAWITCH

Field Service Lightning location based workorder checkout

Custom Metadata Types or JSON config Files?

- ▶ We started using custom metadata types exclusively.
 - ▶ Time consuming for map layer configuration
 - ▶ Unable to view and edit all layer configurations at once
- ▶ Ended up using JSON to manage map layer configuration ✓
 - ▶ Easy to read and edit
 - ▶ Copy and paste configuration blocks

```
    "gisLayerConfigMap" : {  
      "Sewer_Fittings" : {  
        "showSublayers" : false,  
        "serviceLayerNameAndIndex" : null,  
        "popupHeaderField" : null,  
        "popupFieldsList" : ["OBJECTID","Facility Identifier","Fitting Type",  
        "parentLayerName" : "Sewer Collection System",  
        "layerURL" : "https://maps.townofcary.org/arcgis1/rest/services/OneCar  
        "layerType" : "Overlay",  
        "layerSubtype" : "Dynamic",  
        "layerName" : "Sewer_Fittings",  
        "layerLabel" : "Sewer Fittings",  
        "layerIndex" : 7,  
        "isLayerListItem" : false,  
        "FACILITYID" : "FACILITYID",  
        "facility_ID" : "Facility Identifier"  
      }  
    }  
  }  
}
```

Pulling ArcGIS Server data into a Salesforce Application

- ▶ This is pretty standard with ArcGIS JavaScript API 3.24
- ▶ Iterate over layers in configuration file and add to map as ArcGISDynamicMapServiceLayers
- ▶ Did not use LayerList digit
 - ▶ Created Bootstrap widget using collapsible list-group
 - ▶ Group Salesforce layers with similar map service layers

Making graphicsLayers for Salesforce Objects

- ▶ Salesforce JSON configuration:

```
    "Cases" : {  
      "sfTableName" : "Case",  
      "queryFields" : "Id, Subject, Asset.Name, CaseNumber, Description, Status, Type, Owner.Name, Reason, Contact.Name, ContactPhone, ContactMobile, Incident_Geolocation_c",  
      "queryDist_KM" : 10,  
      "queryConditions" : "WHERE Incident_Geolocation_latitude_s != null",  
      "parentLabel" : "Cases",  
      "minScale" : 25000,  
      "locationField" : "Incident_Geolocation_c",  
      "linkId" : null,  
      "linkAddress" : false,  
      "layerStyle" : {"style" : "circle", "color" : {"b" : 2, "g" : 255, "r" : 2, "a" : 1}, "size" : 8, "outline" : {"width" : 1.3333333333333333, "color" : {"r" : 0, "g" : 0, "b" : 0, "a" : 1}, "style" : "solid"}},  
      "layerName" : "Cases",  
      "layerLabel" : "Cases",  
      "layerFieldsLabels" : "Subject, Asset Name, Case Number, Description, Status, Type, Owner Name, Reason, Contact Name, Contact Phone, Contact Mobile",  
      "layerFields" : "Subject, Asset.Name, CaseNumber, Description, Status, Type, Owner.Name, Reason, Contact.Name, ContactPhone, ContactMobile",  
      "assetAccountName" : null  
    },  
    "Cases" : {  
      "sfTableName" : "Case",  
      "queryFields" : "Id, Subject, Asset.Name, CaseNumber, Description, Status, Type, Owner.Name, Reason, Contact.Name, ContactPhone, ContactMobile, Incident_Geolocation_c",  
      "queryDist_KM" : 10,  
      "queryConditions" : "WHERE Incident_Geolocation_latitude_s != null",  
      "parentLabel" : "Cases",  
      "minScale" : 25000,  
      "locationField" : "Incident_Geolocation_c",  
      "linkId" : null,  
      "linkAddress" : false,  
      "layerStyle" : {"style" : "circle", "color" : {"b" : 2, "g" : 255, "r" : 2, "a" : 1}, "size" : 8, "outline" : {"width" : 1.3333333333333333, "color" : {"r" : 0, "g" : 0, "b" : 0, "a" : 1}, "style" : "solid"}},  
      "layerName" : "Cases",  
      "layerLabel" : "Cases",  
      "layerFieldsLabels" : "Subject, Asset Name, Case Number, Description, Status, Type, Owner Name, Reason, Contact Name, Contact Phone, Contact Mobile",  
      "layerFields" : "Subject, Asset.Name, CaseNumber, Description, Status, Type, Owner.Name, Reason, Contact.Name, ContactPhone, ContactMobile",  
      "assetAccountName" : null  
    }  
  }  
}
```

- ▶ Create graphicsLayers for later use:

```
var graphicsLayer = new GraphicsLayer({  
  id: "GraphicsLayer_" + layerName  
});  
var symbol = new SimpleMarkerSymbol(symbolJSON);  
var renderer = new SimpleRenderer(symbol);  
graphicsLayer.setRenderer(renderer);
```

Add Salesforce data to graphicsLayer

- ▶ AJAX Toolkit (connection.js): sforce object
- ▶ Salesforce DISTANCE query using the map centerPoint:

```
▶ var query = "SELECT " + salesforceLayerConfigMap[layerName].queryFields + " FROM " +  
salesforceLayerConfigMap[layerName].sfTableName + " " + salesforceLayerConfigMap[layerName].queryConditions +  
" AND DISTANCE(" + salesforceLayerConfigMap[layerName].locationField +  
", GEOLOCATION(" + centerPoint.y + "," + centerPoint.x + "), 'km')<" + salesforceLayerConfigMap[layerName].queryDist_KM;  
var result = sforce.connection.query(query);  
var records = result.getJSONArray("records");
```

- ▶ Loop over the records returned by the distance query and add graphics to the graphics layer.
- ▶ Create a map.on “extent-change” event to update the graphics in the graphics layer using the DISTANCE query again.

Linking assets to a case from the web map

- ▶ Query the Asset table using sforce.connection:

```
var query = "SELECT Id, Name FROM Asset WHERE Id = '" + assetId + "' LIMIT 1";  
var result = sforce.connection.query(query);  
var recordsString = JSON.stringify(result.getArray("records")[0]);  
var records = JSON.parse(recordsString)
```

- ▶ Message from map to the Map_iFrame.cmp:

```
var msg = '{"instanceId": "Map_Asset_Link", "caseAssetId": "' + records.Id + '", "caseAssetName": "' + records.Name + '"}';  
window.parent.postMessage(msg, lDomain);
```

- ▶ Fire an event from the iFrame.cmp to the caseIntakePage.cmp:

```
var setCaseAssetEvent = $A.get('e.c:SetCaseAssetEvent');  
setCaseAssetEvent.setParams(  
  {  
    instanceId: instanceId,  
    caseAssetId: caseAssetId,  
    caseAssetName: caseAssetName  
  });  
setCaseAssetEvent.fire();
```

- ▶ Update caseAsset component with the assetId:

```
var caseAsset = component.find('caseAsset');  
caseAsset.setLookup(eventParams.caseAssetId);
```
