

ArcGIS Enterprise: Architecting Your Deployment

Philip Heede

2019 ESRI DEVELOPER SUMMIT
Palm Springs, CA

Assumptions and prerequisites

- You know what the ArcGIS Enterprise product is and understand the capabilities
- You are an IT administrator (or work as one) who architects and/or installs the software

Recommended prerequisites:

- Prior familiarity with ArcGIS Server
 - E.g. you know what an ArcGIS Server 'site' is.

Bonus prerequisites:

- Prior familiarity with Portal for ArcGIS
 - E.g. you're familiar with the concept of 'federating' an ArcGIS Server site with the portal

Don't panic

The background features a complex, abstract composition of overlapping, semi-transparent geometric shapes. These shapes, including rectangles and polygons, are rendered in various shades of blue, teal, and purple. They are arranged in a way that creates a sense of depth and movement, with some shapes appearing to be layered on top of others. The overall effect is a vibrant, modern, and somewhat chaotic visual texture that contrasts with the clean, white text.

Software Components

Server Licensing Roles

One software component, multiple server roles

* GeoEvent Server requires installing the ArcGIS Server software + overlaying the GeoEvent Server setup

** Notebook Server is a separate download and install that does not require the main ArcGIS Server setup

Notebook
Server**
(new at 10.7!)

Coming from ArcGIS Server to ArcGIS Enterprise

Typical deployment of ArcGIS Server

Base deployment of ArcGIS Enterprise

Base Deployment Logical Architecture

Base Deployment Logical Architecture

ArcGIS Web Adaptor

Integrates with your organization's existing web server to provide a single endpoint that **distributes incoming requests** and enables you to use **web-tier authentication**.

Base Deployment Logical Architecture

Portal for ArcGIS

The software component that enables the ArcGIS Enterprise portal. Portal for ArcGIS is the **web frontend and API backend** that supports a user's interaction and overall experience with your Web GIS.

Base Deployment Logical Architecture

ArcGIS Server

In a base deployment ArcGIS Server should be configured with a **GIS Server licensing role** and as **the hosting server**. In this capacity it gives you the ability to **publish and share** maps and layers from ArcGIS Pro using your own business databases and by copying data to the server.

Base Deployment Logical Architecture

ArcGIS Data Store

The ArcGIS **managed data repository** that stores the Enterprise portal's hosted content. It is not a replacement for your enterprise geodatabases.

Base Deployment Logical Architecture

ArcGIS Data Store

- Relational
- Tile Cache
- Spatiotemporal

ArcGIS Enterprise

Introducing ArcGIS Enterprise

What is ArcGIS Enterprise?

What's new in ArcGIS Enterprise 10.7

Upgrade ArcGIS Enterprise

Base ArcGIS Enterprise deployment

ArcGIS Enterprise Builder

Tutorial: Set up a base ArcGIS Enterprise deployment

Base ArcGIS Enterprise deployment

ArcGIS 10.7 (Windows) | Other versions

ArcGIS Enterprise comprises four software components. The minimum setup of ArcGIS Enterprise is called a base ArcGIS Enterprise deployment, and consists of the following:

- ArcGIS Server, licensed as ArcGIS GIS Server Standard or ArcGIS GIS Server Advanced and configured as the hosting server for your portal.
- Portal for ArcGIS.
- ArcGIS Data Store, configured as a relational and tile cache data store.
- Two installations of ArcGIS Web Adaptor, one installation for traffic to your ArcGIS Enterprise portal and another for traffic to your hosting server.

In this topic

- Single-machine deployment
- Multi-machine deployment
- Set up a highly available deployment
- Scaling the base ArcGIS Enterprise deployment

Functionality of the base deployment

- **Everything from traditional ArcGIS Server**
 - Ability to publish map services, feature services, network services, geoprocessing services, geocoding services, and much more.
 - Ability to publish content from referenced data sources such as file-based data (file geodatabases, shapefiles) as well as enterprise geodatabase and other spatially enabled databases.
- **Ability to give users option to do self-service mapping**
 - Publishing hosted data where users do not need access to enterprise geodatabase or trusted file shares- they can copy data to the system in a seamless fashion similar to the experience from ArcGIS Online
- **Story maps and other configurable app templates**
- **Web AppBuilder for quickly creating customized web apps**
- **Full suite of Esri apps and other custom apps built on the ArcGIS API for Javascript and ArcGIS Runtime SDKs**

Base Deployment | Choosing a pattern

- **Choosing a base deployment pattern**

- **All-in-one single machine deployment**
 - Great, simple approach for small and medium sized organizations

- **Multi-tier deployment**

- **Three tiers to consider:**

- **Portal for ArcGIS (web tier)**
- **ArcGIS Server (app tier)**
- **ArcGIS Data Store (data tier)**

Scaling and expanding the base deployment

- **When do you need to scale out the Portal for ArcGIS tier?**
 - Rarely!
 - Provide more resources for your existing machine(s)
 - Note: Use two machines with Portal for ArcGIS for high availability purposes *not* for scaling
 - Monitor CPU and memory usage to see if you need more resources

Scaling and expanding the base deployment

- **When do you need to scale out the ArcGIS Server hosting server site?**
 - **If your hosting server is performing double duty:**
 - Hosted services
 - Traditional services published from ArcMap or ArcGIS Pro
 - **Consider setting up a separate ArcGIS Server site for this purpose!**

 - **Hosting server resources can become an issue:**
 - Serving a lot of requests for hosted feature layers
 - If your users are making heavy use of the built-in analysis tools via the map viewer or ArcGIS Pro
 - If you have a lot of Insights for ArcGIS users

Scaling and expanding the base deployment

- **When do you need to scale out the ArcGIS Data Store tier?**
 - Two different types of data stores in the base deployment

- **Relational Data Store**
 - Hosted feature layers
 - Insights for ArcGIS

- **Tile Cache Data Store**
 - Scene Layers (3D)

When to scale relational data store:

- Lots of users requesting data concurrently from many different hosted services: more memory often helpful
- Lots of concurrent requests: CPU can become a bottleneck

- Monitor for bottlenecks!

- Consider ArcGIS Monitor
- CPU, memory, disk I/O are all important
- Pre-10.5.1 versions do not always handle out of disk space conditions gracefully. Avoid running out of disk space!

Note: the spatiotemporal big data store is not part of the base deployment. It supports GeoEvent Server, GeoAnalytics Server, and Tracker for ArcGIS workflows covered in later slides.

Deploying

The background features a vibrant, abstract design. It consists of several overlapping, diagonal stripes in shades of blue, green, and yellow. On the right side, there is a stylized map of Europe, with various countries outlined in white. The overall aesthetic is modern and dynamic, suggesting a focus on technology or global communication.

Base Deployment Configuration Quick Steps

1 configure Web Adaptors

Base Deployment Configuration Quick Steps

2 configure the data store and register with server

Base Deployment Configuration Quick Steps

3 federate server with the portal and designate as hosting server

Upgrade ArcGIS Enterprise

Base ArcGIS Enterprise deployment

➤ ArcGIS Enterprise Builder

Tutorial: Set up a base ArcGIS Enterprise deployment

Tutorial: Set up a base ArcGIS Enterprise deployment

ArcGIS 10.7 (Windows) | [Other versions](#) ▼

This tutorial provides an overview of setting up a single machine [base ArcGIS Enterprise deployment](#). This configuration is commonly used for testing and prototyping purposes. It enables self-service mapping and can be used with ArcGIS Pro, ArcMap, and other client applications. Although this configuration can be used in a production system, your performance, system architecture, and other requirements will dictate the deployment pattern your production deployment follows.

The resulting deployment will include the following:

How to deploy

It's not all about deploying components by hand anymore!

For GIS professionals

ArcGIS Enterprise Builder

A wizard that installs and configures ArcGIS Enterprise on a single machine.

For those who want to deploy in the cloud

Machine Images

Easily deploy and configure ArcGIS Enterprise in the two most popular public cloud environments.

For those with DevOps

Chef

Automate installation and configuration in your infrastructure.

PowerShell DSC

Scaling out

The background features a vibrant blue gradient. On the right side, there is a complex, layered graphic composed of various geometric shapes and patterns. These include overlapping triangles, rectangles, and lines in shades of green, yellow, pink, and blue. A faint map of Europe is visible within these layers, particularly in the lower right quadrant. In the top left corner, there are several thin, parallel lines in green, yellow, and pink, extending diagonally across the frame.

Expanding out from the base deployment

A couple of starting points:

- **You can have any number of federated ArcGIS Server sites within your ArcGIS Enterprise deployment**
- **Different server roles have different recommendations and restrictions**

Expanding out from the base deployment

- Multiple reasons and ways to add to the base deployment

1. Adding additional GIS Server sites

- Isolate hosting server site from traditional GIS Server duties
- Have dedicated GIS Server sites for various purposes: heavily used map services, geoprocessing services, ...

2. Adding additional capabilities

- Image Server
- GeoEvent Server
- GeoAnalytics Server

GIS Server

The background features a vibrant blue gradient. On the right side, there is a complex, layered graphic composed of various geometric shapes and patterns. These include overlapping translucent polygons in shades of green, yellow, pink, and blue. A faint, stylized map outline is visible within these layers, particularly in the lower right quadrant. In the top left corner, there are several thin, parallel lines in green, yellow, and pink, extending diagonally across the frame.

Adding additional GIS Server sites to your deployment

- GIS Server

- You already have a GIS Server site as part of the base deployment
- Consider if you need additional sites- you can setup as many sites as make sense for your particular deployment following workload separation recommendations
- Common workloads that benefit from separate site(s):
 - Highly used sets of dynamic map services
 - Heavy-weight geoprocessing
 - CPU-intensive routing services
 - Mission critical services that have different SLAs than other services
- Note new *Shared Instances* feature in ArcGIS Enterprise 10.7:
 - Memory consumption of map services not typically a reason to scale out
 - number of *requests* may drive need to scale out
 - number of *services* shouldn't have to be

Adding additional GIS Server site to your deployment

Adding additional GIS Server site to your deployment

Image Server

The background features a vibrant, abstract composition of overlapping geometric shapes in shades of teal, green, yellow, and pink. On the right side, a stylized map of Europe is visible, rendered in a light blue and green color scheme. The overall aesthetic is modern and digital.

Adding Image Server to your deployment

- Image Server provides two distinct capabilities

- Dynamic image services from your own mosaic datasets

- Serve large collections of imagery and rasters with dynamic mosaicking and on-the-fly processing
- N number of sites

- Raster Analytics

- Extracting information from imagery- distributed processing and analysis of imagery and rasters creating new persisted output at full source resolution
- Only 1 site can do raster analytics
- Choose whether to have separate site for raster analytics or one site for both traditional dynamic image services and raster analytics.
- At 10.5-10.6 the results of raster analytics will always be hosted out of the raster analytics site. Beginning at 10.6.1, you have the option of designating a separate *image hosting* site that will be the site that hosts results from raster analytics.

Adding Image Server to your deployment

One Image Server site for both capabilities

Adding Image Server to your deployment

Separate Image Server sites for each capability

GeoAnalytics Server

The background features a vibrant blue gradient. On the right side, there is a complex, layered geometric design with diagonal lines in shades of green, yellow, pink, and blue. A faint outline of a world map is visible within these layers. In the top-left corner, there are several overlapping, semi-transparent rectangular shapes in various colors (green, yellow, pink, blue) that appear to be part of a data visualization or interface element.

Adding GeoAnalytics Server to your deployment

- **GeoAnalytics Server provides distributed computing infrastructure for processing large volumes of vector and tabular data** 
 - **One site for GeoAnalytics Server**
 - **Requires spatiotemporal big data store to be configured with the base deployment**
 - **Note: ArcGIS Data Store (relational, tile cache, spatiotemporal) is always configured with *the hosting server site***
 - **Provide at least 16 GB memory and at most 64 GB for spatiotemporal big data store**
 - **Many variables go into sizing deployment**
 - **More machines or more cores or more memory does *not* always mean faster processing!**
 - **Many workflows benefit immensely from just a 1 machine GeoAnalytics Server setup**
 - **If possible: scale a single machine, it's simpler to manage. Scale to 3 machines when needed. Not supported to use configurations other than 1 or 3 machines.**

Make sure to use ArcGIS Enterprise 10.7 and GeoAnalytics Server 10.7!

GeoAnalytics Server performance considerations

- **Variables that affect performance**

- **Type of data: file-based (CSV, shapefiles) vs. web-based (feature service) vs. big data store (HDFS, Hive, Azure Data Lake)**
- **Location of data: local (low latency) vs. on network (higher latency)**
- **LAN characteristics: 100 mbps vs. 1 gbps, latency between machines and data source**
- **Characteristics of data storage system: SSD vs. traditional HDD (disk I/O)**
- **Size of data: tens of MB vs. hundreds of MB vs. gigabytes vs. terabytes**
- **Ratio of CPU cores to amount of memory per core**
- **Ability to write result data as fast as it is being generated (scale spatiotemporal big data store too!)**
- **Likely many more..**

Prototype deployment using your own data and workflows

Adding GeoAnalytics Server to your deployment

Minimum 3 machines to support base deployment + GA + spatiotemporal; scale the GeoAnalytics site from 1 to 3 machines beyond that

Adding GeoAnalytics Server to your deployment

Remember to scale spatiotemporal big data store with additional nodes when going from 1 to 3 GeoAnalytics Server machines

GeoEvent Server

The background features a vibrant blue gradient. On the right side, there are several overlapping, diagonal stripes in shades of green, yellow, pink, and blue. These stripes have a 3D effect, appearing to recede into the distance. In the lower right corner, a faint outline of a world map is visible, with some regions highlighted in a light green color. The overall aesthetic is modern and tech-oriented.

Adding GeoEvent Server to your deployment

- **GeoEvent Server provides the ability to create GeoEvent services to process real-time data ingestion and processing**  
- **At GeoEvent Server 10.5 and prior the strong recommendation is to use *single machine* sites. With GeoEvent Server 10.6 and up it is possible to scale out a site.**
- **Each site must be powerful enough to handle peak throughput for the combined set of GeoEvent services (scale up!)**
- **To handle multiple input stream that go beyond a single site: use additional separate GeoEvent Server sites**
- **Archiving large volumes of data: use spatiotemporal big data store**

Adding GeoEvent Server to your deployment

Adding GeoEvent Server to your deployment

Adding GeoEvent Server to your deployment

Use multiple single machine sites to scale for 10.5.x; don't use multi-machine sites for GeoEvent Server 10.5.x and prior

Adding GeoEvent Server to your deployment

For 10.6 and higher: scale out individual GeoEvent Server sites with multiple machines for resiliency and capacity

Recap: expanding out from the base deployment

- GIS Server 
 - as many sites make sense for your particular deployment following workload separation recommendations
 - E.g. separate sites for different sets of map services, separate sites for heavy-weight geoprocessing, separate sites for CPU-intensive routing services, ..
- Image Server 
 - as many sites make sense for your particular deployment of *dynamic image services*
 - *there can only be one site for raster analytics*
- GeoAnalytics Server 
 - *there can only be one site for GeoAnalytics Server*
- GeoEvent Server 
 - as many sites as makes sense for your particular deployment
 - *at 10.5.1 and prior: strong recommendation to use single machine sites*

Other important topics

Dispelling old myths and updating best practices

- **Do *not* use clusters!**
 - Discouraged on any version. Officially deprecated as of 10.5.1.
No longer supported supported in 10.7!
- **Do federate your ArcGIS Server sites**
 - Required for the modern deployment patterns and newer functionality
- **Do use the web adaptor unless there's a good technical reason not to**
 - Simplifies a lot of configuration that otherwise has to be done manually.

Dispelling old myths and updating best practices

- **“Windows can only run ~250 service instances (SOC processes)”**
 - This is a Windows imposed limitation that can be lifted by changing Windows settings
 - Edit the registry: <http://support.esri.com/technical-article/000001218>
- **New at ArcGIS Enterprise 10.7: *shared instances!***
 - Ability to have most ArcGIS Pro-based map services run in a shared instance pool
 - Cuts the memory cost of publishing additional services to *zero*

Takeaways

- Understand the base deployment
- Don't overcomplicate things unnecessarily: small to medium-sized organizations can often use a single machine base deployment in production.
- Stay up to date on best practices. They change over time!
 - What was good advice for 10.2/10.3/.. is not necessarily as good for 10.6/10.7/..
- ArcGIS Enterprise is designed for the federated server model
 - Features that require the federated server model:
 - 3D scene layers, Vector Tile Layers, Utility Network, Parcel Management (coming at 10.7.1)
 - Raster Analytics and GeoAnalytics
 - Archiving large volumes of data from GeoEvent Server
 - ...
- Understand the individual server roles and the recommendations and requirements of each- they're not all the same!

Don't panic

The background features a complex, abstract composition of overlapping, semi-transparent geometric shapes. These shapes, including rectangles and polygons, are rendered in a variety of colors such as deep blue, teal, light green, and purple. The shapes are layered and oriented in different directions, creating a sense of depth and movement. The overall effect is a vibrant, modern aesthetic that complements the central text.
