

Federal GIS Conference

February 9–10, 2015 | Washington, DC

ArcGIS Enterprise Systems: Designing, Testing and Monitoring

Jim VanOstenbridge, jvanostenbridge@esri.com>

Martin Hamann, MHamann@esri.com

Andrew Sakowicz, asakowicz@esri.com

Federal GIS Conference

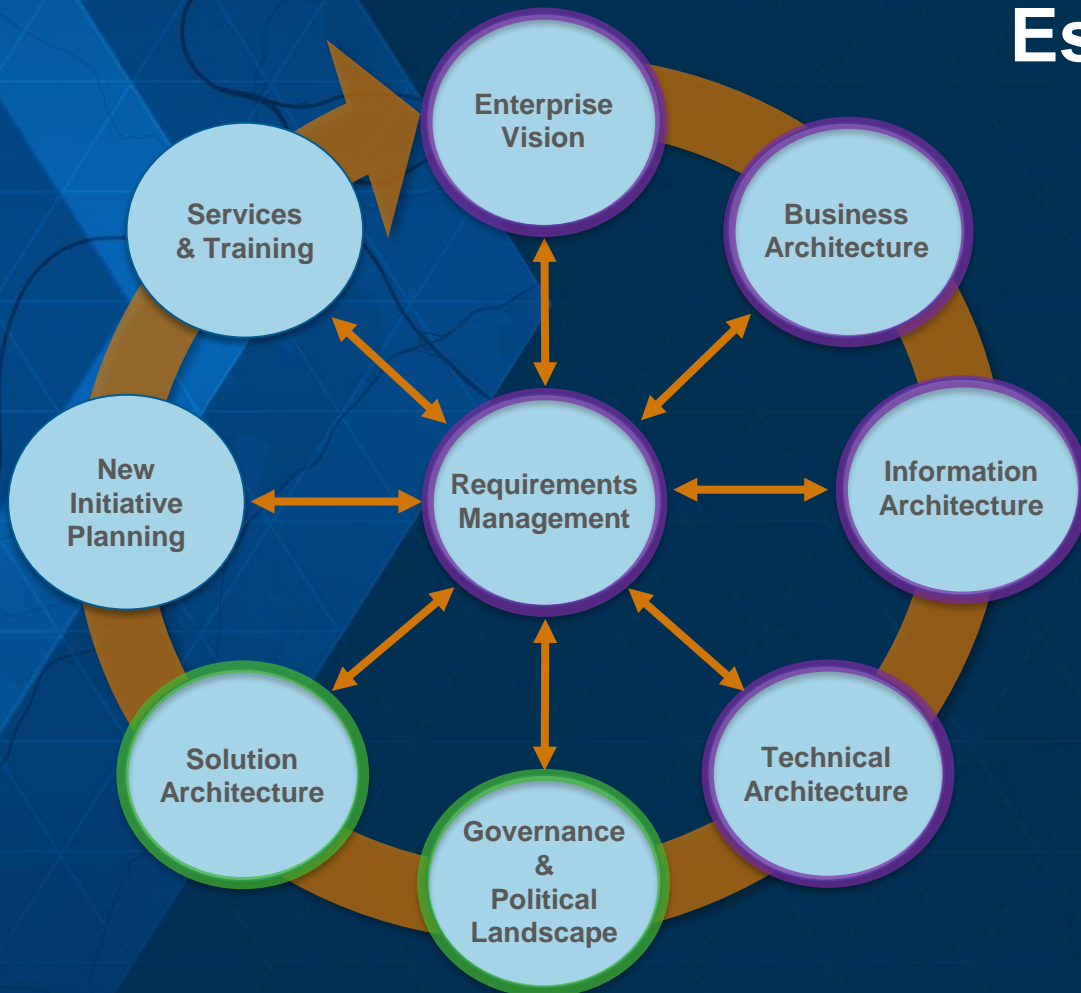

February 9–10, 2015 | Washington, DC

Agenda

- **Esri's Solution Architecture Practice**
- **Overview of System Tools**
- **System Test and System Monitor Case Study**

Esri's Solution Architecture Practice

- **GIS platform strategy**
- **Align resources to realize intended business outcomes**
- **Develop initial impressions of SLAs**
 - Performance
 - Scalability
 - Availability
- **Develop Solution Road Map**
 - Recommendations
 - Prescriptive activities

Best Practice: Leverage System Tools

- **Defined:** software tools to help plan, test and monitor a system implementation.
- **Maintain SLA's**
- **Transparency into system**
- **Tune system stability & availability**
- **Identify “bottlenecks”**
- **Reduce risks**
- **Optimize spend**
- **Improved capacity planning**

**System
Monitor**

**System
Designer**

**System
Test**

Definitions

Performance

- Speed, e.g. response time (seconds)

Scalability

- The ability to increase output and maintain acceptable performance

Capacity

- The maximum level of output the system can produce, e.g.
- X cars/sec
- X maps/sec

At capacity

Over capacity

Bottleneck

- Resource(s) limiting the performance or capacity

Not bottleneck

bottleneck

Think of :

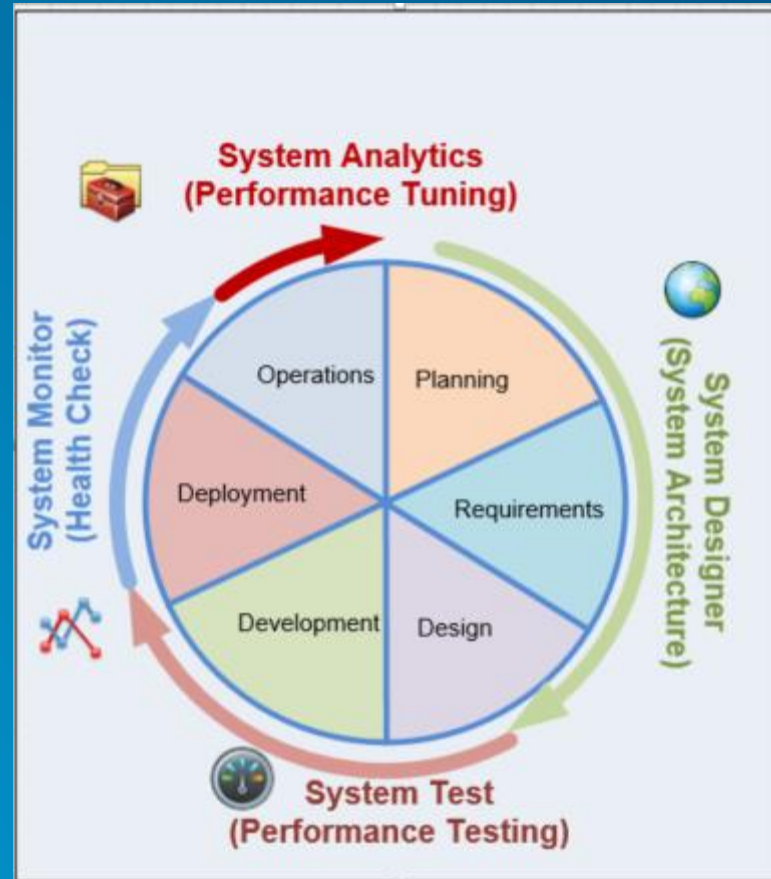

Lanes -as CPU processor

Toll -as ArcGIS Server instances

Cars -as map requests

Process and Tools

Relationship between System Tools

System Tools framework

System Tools are not just tools

Infrastructure Capacity Planning

Provide sufficient hardware resources

Most systems are CPU bound

GIS Systems are bound by:

- 1. CPU - typically**
- 2. Memory – when large number of services**
- 3. Disk – Image Service, Synchronization**
- 4. Network – low bandwidth deployment**
- 5. Poorly configured virtualization can result in 30% or higher performance degradation**

Most well-configured and tuned GIS systems are CPU bound.

Infrastructure

Memory requirements

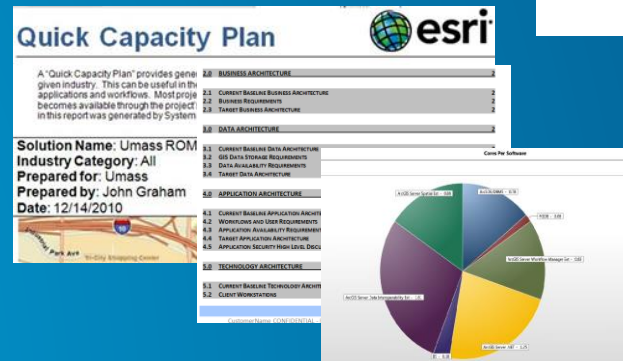

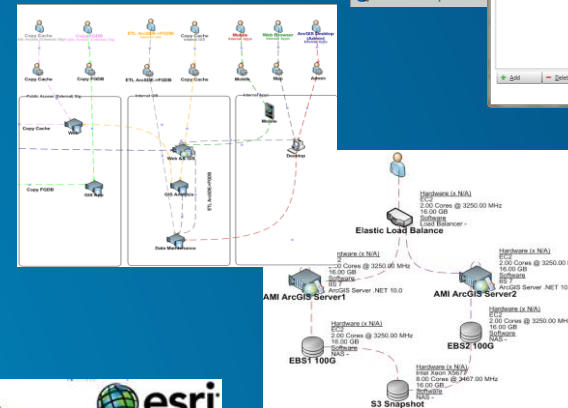

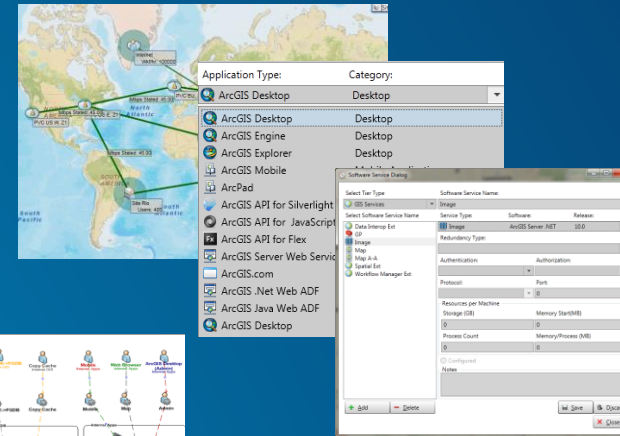

| Item | Low | High |
|------------------|--------|----------|
| ArcSOC Map | 50 MB | 500 MB |
| ArcSOC Image | 20 MB | 1,024 MB |
| ArcSOC GP | 100 MB | 2,000 MB |
| XenApp Session | 500 MB | 1.2 GB |
| Database Session | 10 MB | 75 MB |
| Database Cache | 200 MB | 200 GB |

Wide ranges of memory consumptions

System Designer

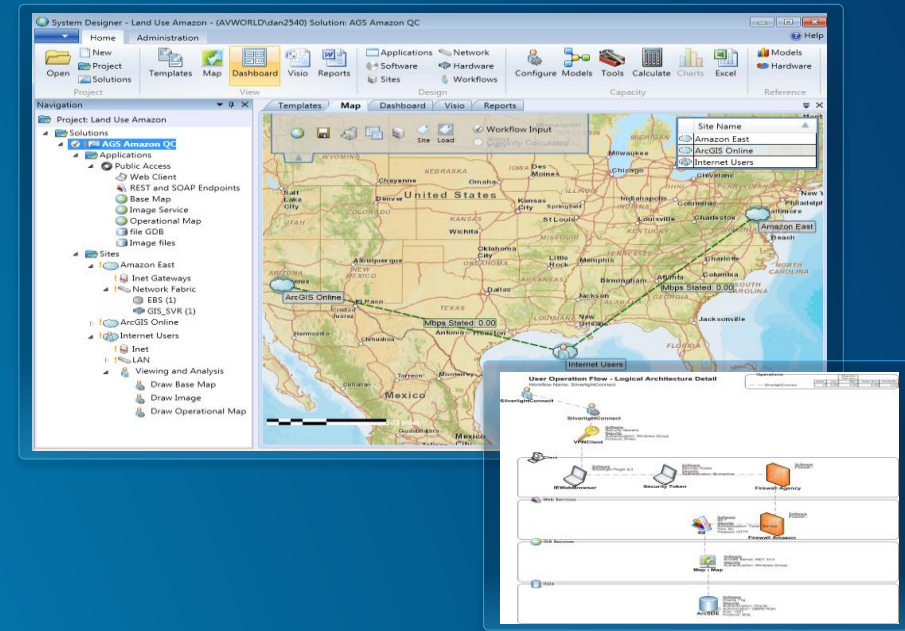

Solution Architecture design methodology

- Gathering requirements
- Designing
- Capacity: CPU, Network, Memory
- Reporting

Demo

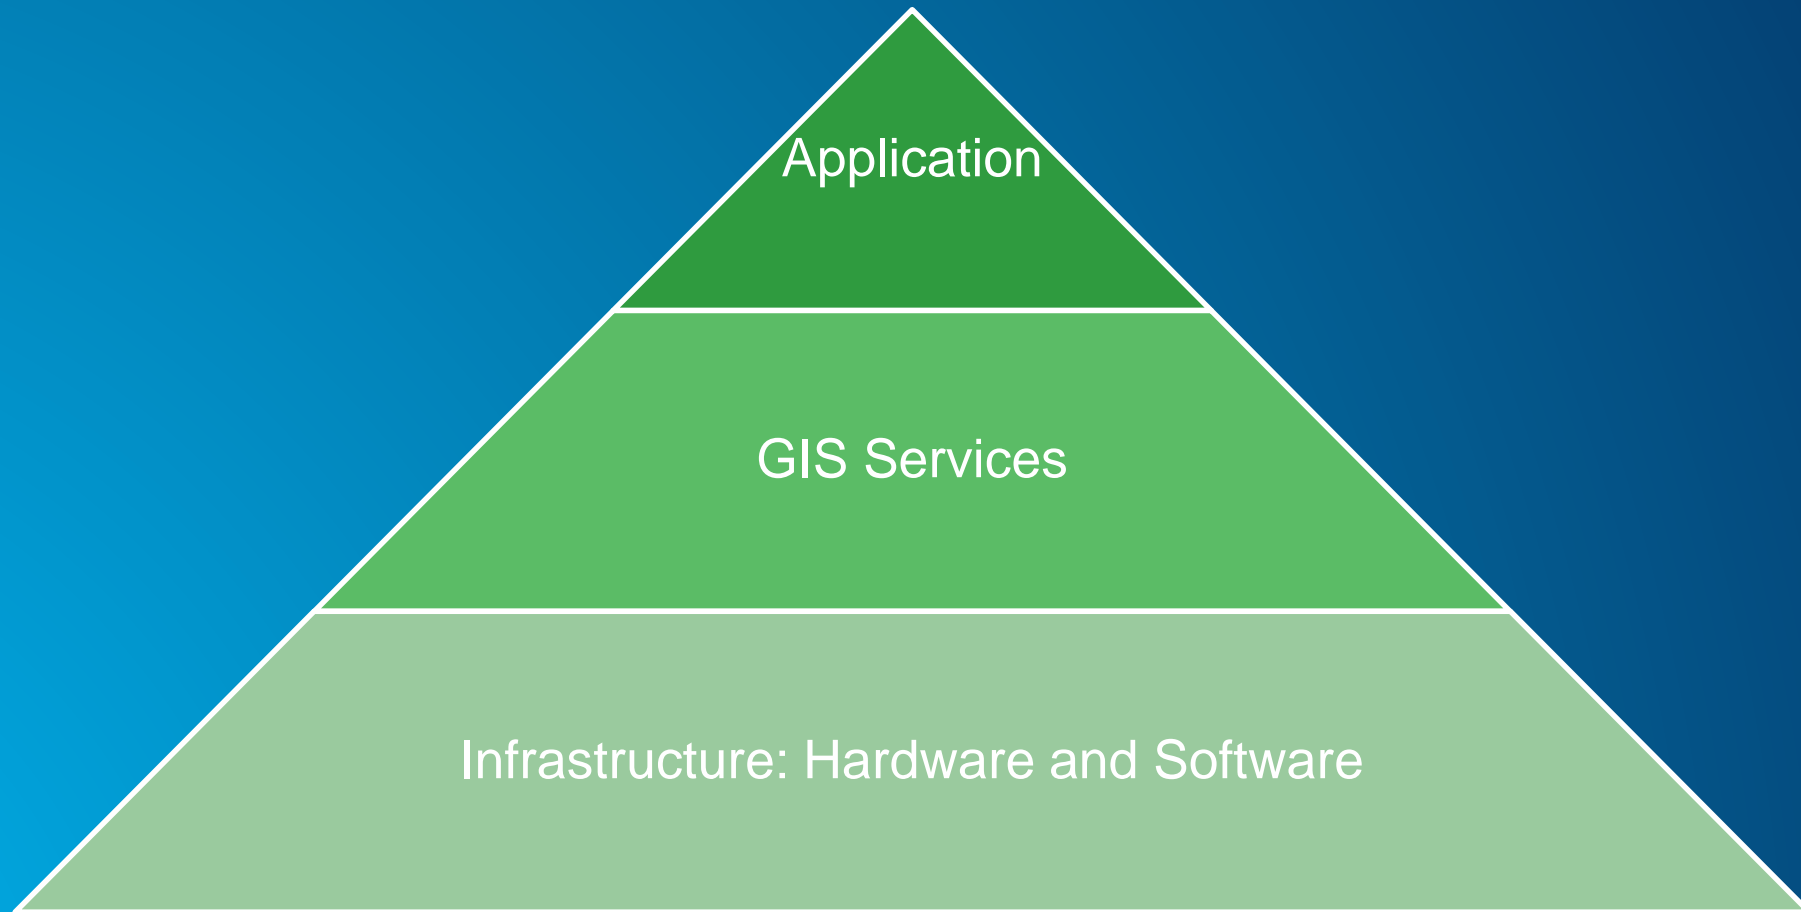

System Designer

Performance Testing

Testing process

Required skill set

Configuration, Tuning, Testing

System Test Tool features

GIS Test Automation

- **ArcGIS Services**
 - Mapping
 - Feature Service
 - OGC
 - Geocoding
 - Image Service
 - Network Analyst
 - Geoprocessing
 - Tile Cache
- **Application Testing**
- **Discipline relevant report**

Test tools feature comparison

| Tool | Cost | Learning Curve | OS Metrics | GIS Data Generation | GIS Test Automation |
|---------------|--------|----------------|----------------------------|---------------------|---------------------|
| Load Runner | High | High | Windows/Linux | No | No |
| Visual Studio | Medium | High | Windows | No | No |
| JMeter | Free | High | Requires additional plugin | No | No |
| System Test | Free | Low | Windows/Linux | Yes | Yes |

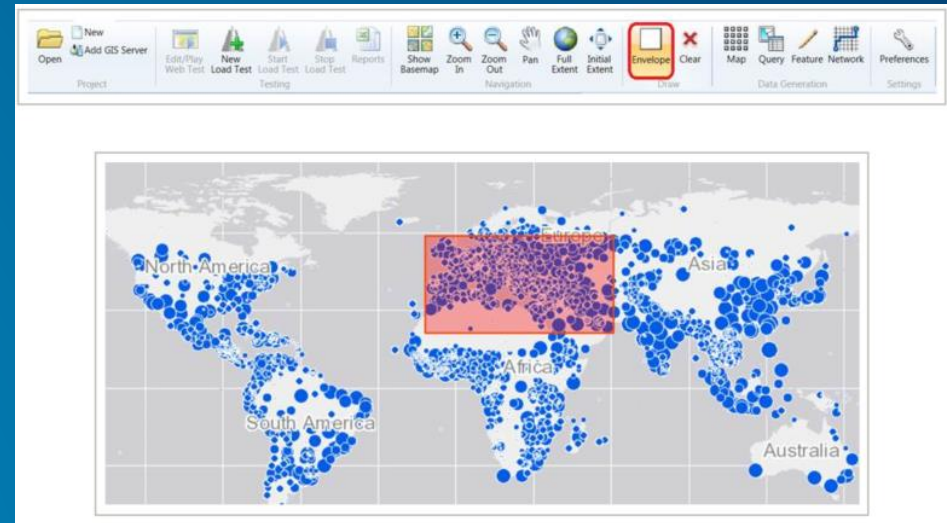

Performance testing

Value

- **Identify bottlenecks**
- **Determine system capacity**
- **Demonstrate performance SLA**

Demo

System Test

System Monitoring

Monitoring Enterprise GIS

Challenges

- **Multiple administrators**
- **Multiple disparate monitoring/diagnostic tools**
- **Data collected in a reactive fashion: on demand and for limited time**
- **Correlation of data with different timestamp is difficult**
- **ArcGIS administrators do not have access to all tools, data and reports**
- **Challenging to quickly identify the root cause and take appropriate measures**

Standards for effective GIS monitoring

- Many excellent monitoring tools on the market
- Few provide GIS dashboards
- System Monitor can be used as reference implementation

Enterprise GIS effective monitoring

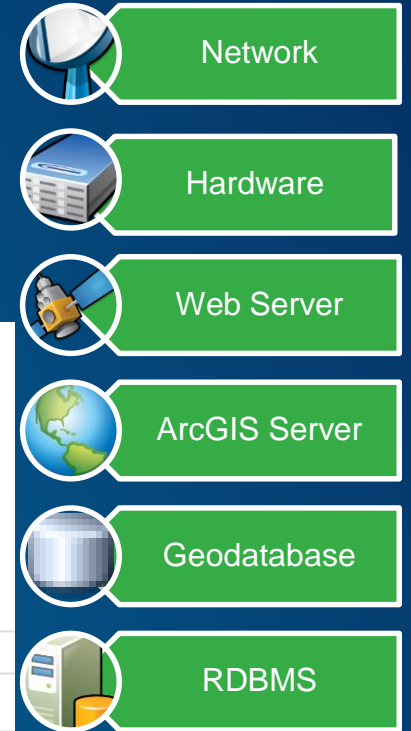

“**PIECE**” of mind with System Monitor

- **P**roactive
- **I**ntegrated
 - Dashboards across all tiers
- **E**nd-to-End
 - All tier monitoring
- **C**ontinuous
 - %Coverage provided
- **E**xtendable
 - Custom queries

Key Performance Indicators:

Hosts Process ArcGIS DB Http RDP

| | % Coverage | % Uptime | % Alert |
|---|------------|----------|---------|
| 1 | 100.00 | 100.00 | 100.00 |
| 2 | 100.00 | 100.00 | 0.00 |
| 3 | 100.00 | 100.00 | 0.00 |
| 4 | 100.00 | 100.00 | 0.00 |
| 5 | 100.00 | 100.00 | 0.00 |
| 6 | 100.00 | 98.75 | 0.00 |

Monitoring

Value

- Proactive validation:

Configuration

Resource Utilization

Usage Trends

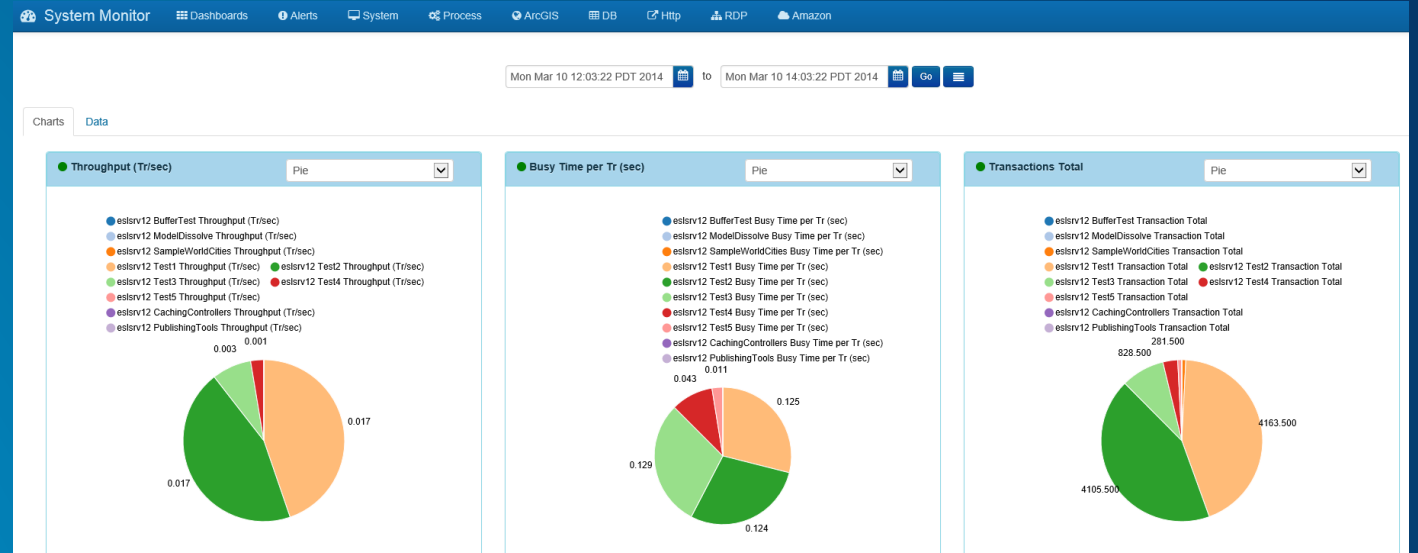

Performance SLA

Uptime SLA

Case Study

Introduction

- **Purpose – provide a practical case study describing how the System Monitor and System Test esri resources can be leveraged when implementing complex mission critical GIS platforms**
- **Case Study – Implementation of a GIS (Platform as a Service) PaaS in a large federal agency with mission critical user communities**
 - Objectives, requirements, and unique challenges
 - High level architecture(s) and organizational context
 - System Monitor and System Test use case examples

Implementation Overview

- **Private cloud service model – enable sponsors to efficiently provide content as standards based GIS services on appropriate infrastructure.**
- **COTS and Open Source technology**
- **Highly Available (HA) infrastructure**

Implementation Overview

- **Mature service features**
 - **Service Level Agreement (SLA)**
 - **Documented on-boarding procedures**
 - **Cost Sharing Model**
- **Dedicated GIS and IT support staff**

Operational Environment and Organizational Considerations

- **All GIS server systems are RHEL VMs (including RDBMS)**
- **Virtual environment is configured and managed using Puppet Labs software**
- **Domain expertise, system accesses, and roles are split between multiple organizations.**

Challenges - GIS vs IT Roles

- **The IT organization SA's manage the infrastructure; VM's, Puppet catalogs, classes, and scripts, software installation and licensing, web servers, and RDBMS including all tasks requiring root or DBA privileges. Windows domain admins are in a separate group**
- **The GIS support team interact with the GIS site(s) through the ArcGIS Desktop applications, or the ArcGIS Server Manager or Admin rest endpoints. The GIS team has some limited access to the RHEL 'Compute Farm' data ingestion servers through SSH shell connections**

Technical Challenges – Complexity, the Usual Suspects

- High availability
- Fault Tolerance
- Scalability in a context of event driven traffic spikes
- Performance
- Security
- Interoperability
- Integration with existing policy and practice
- Infrastructure Environment

Technical Challenges – Project Specific

- **Time enabled services based on continuously updating data feeds**
- **Scientific and environmental data sources require pre-processing to enable or optimize for dissemination as GIS web services**
- **These narrow performance optimization options (e.g. caching)**

Representative Services and Update Cycles

| Service | Update Frequency | Performance Workflow | Nominal Map/Image requests (Est) | Peak Map/Image requests (Est) |
|---|-----------------------|----------------------|----------------------------------|-------------------------------|
| Watches\Warnings and Advisories | 1 minute \ 10 minutes | Light Vector | 10K Hr | 100K Hr |
| Daily Global Precipitation | Daily | Light Raster | 1K Hr | 10K Hr |
| Radar (1x1 km base reflectivity) | 5 minutes | Light Raster | 20K Hr | 200K Hr |
| HRRR | 15 minutes \ 1 hour | Heavy Raster | UNK | UNK |
| Hurricane Tracks/Wind/Surge | 10 minutes or less | Light Vector | 1K Hr | 100K Hr |
| AHPS gauges | 15 minutes | Light Vector | 1K Hr | 10K Hr |
| Flood Outlook Product | Daily | Light Vector | 1K Hr | 10K Hr |
| CPC Weather Hazards | Daily | Light Vector | 10K Hr | 100K Hr |
| Quantitative Precipitation Forecast (QPF) | 15 minutes | Light Vector | 1K Hr | 10K Hr |
| Weather Features | Daily | Light Raster | 1K Hr | 10K Hr |
| Sea Surface Temp | Daily | Light Raster | 1K Hr | 10K Hr |
| NDFD Wind Velocity Forecasts | 1 hour | Light Raster | 1K Hr | 10K Hr |

Data ingestion workflow for (gridded) scientific datasets

Data Ingestion workflow for time-stamped vector datasets

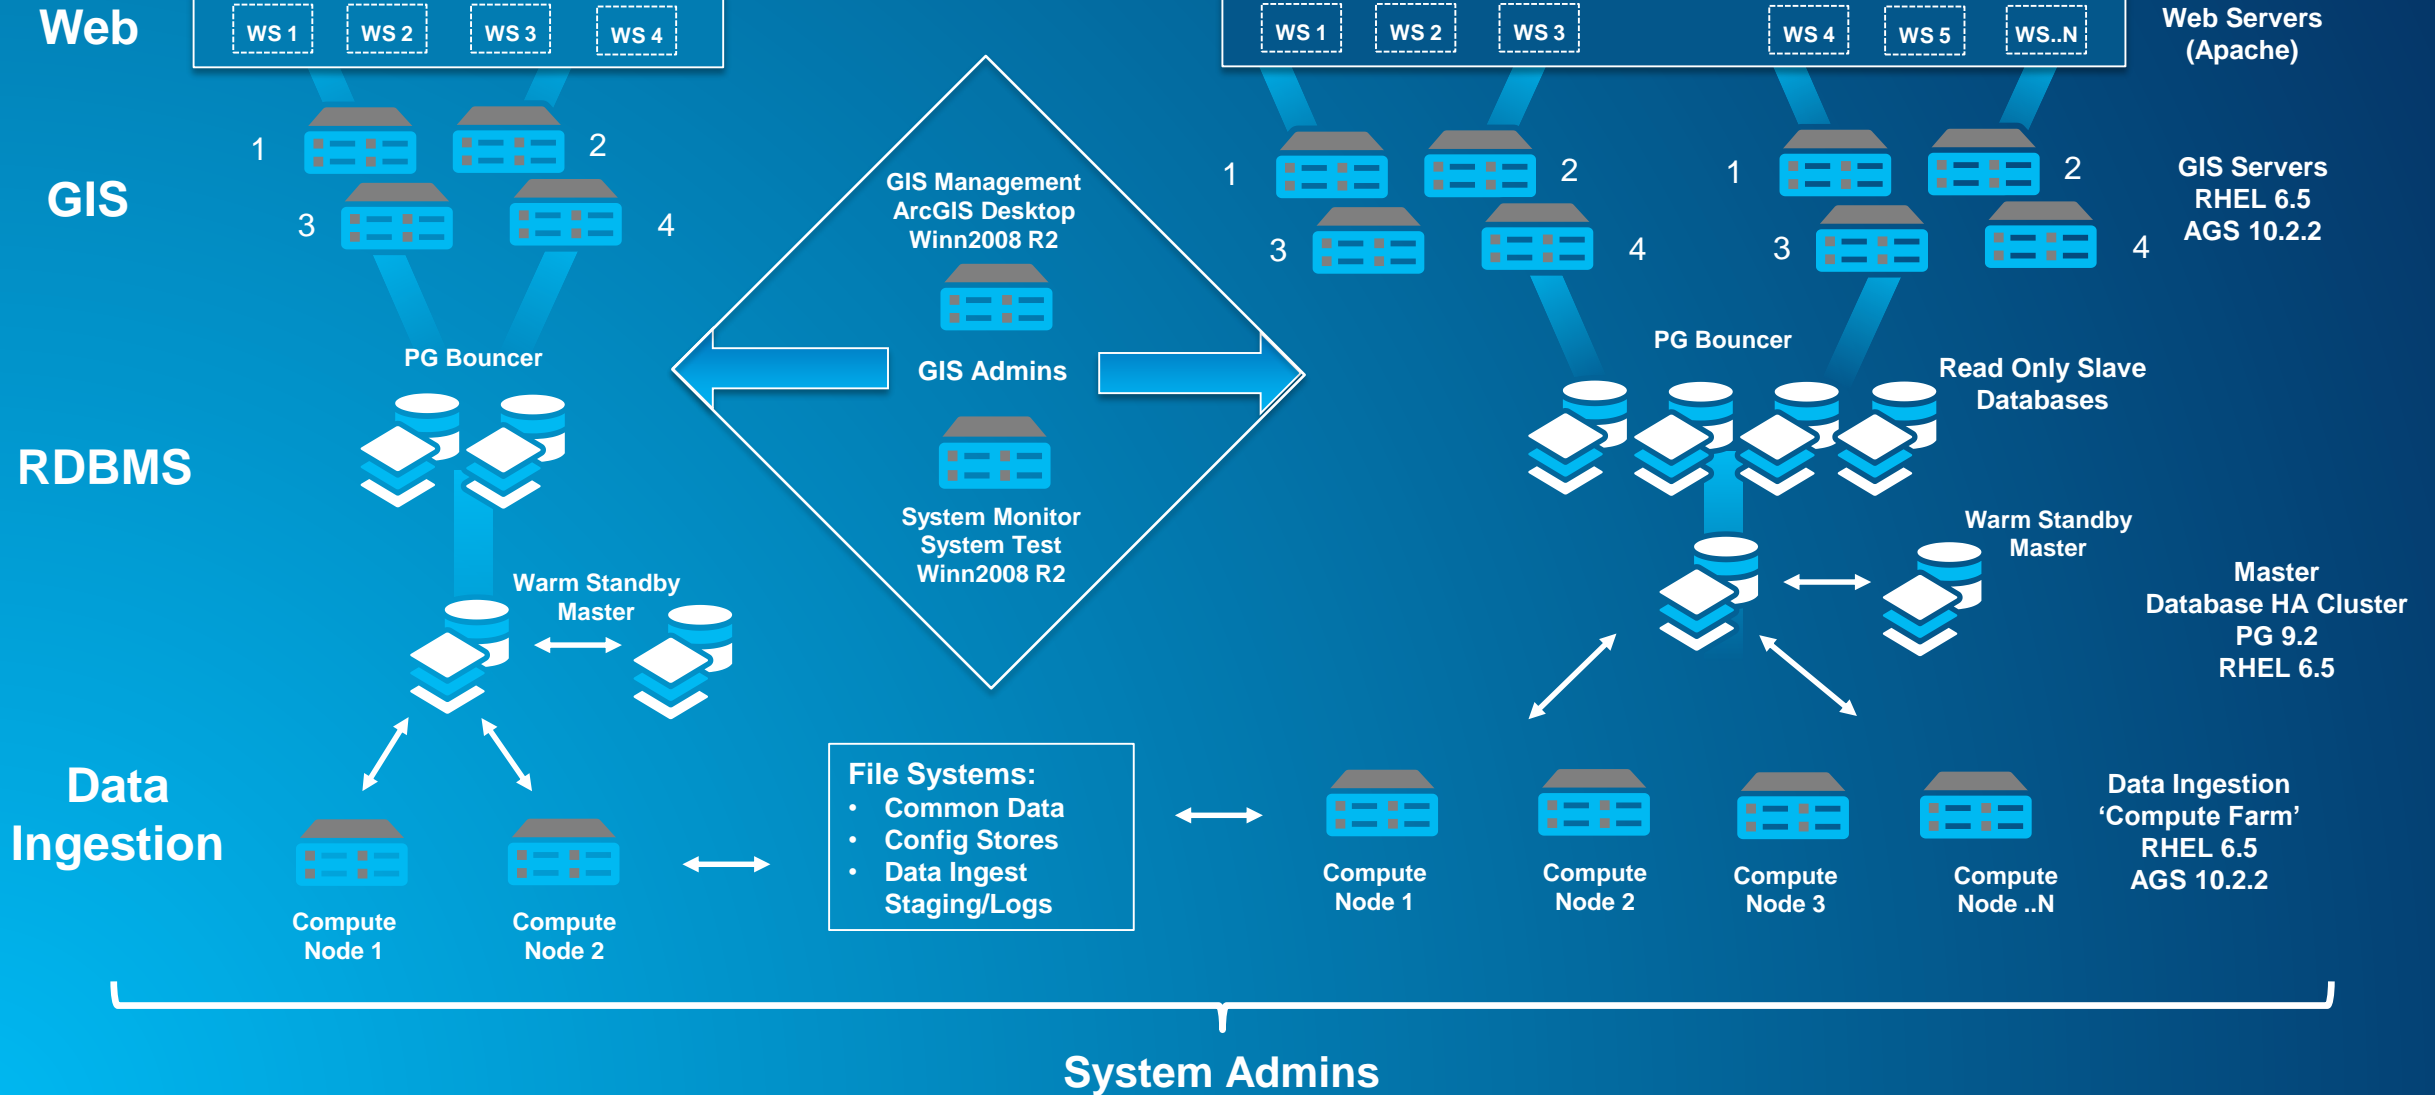

Continuous Update Services High Level Architecture

QA – Integration Test Site

Production Sites

ArcGIS Server Site A

ArcGIS Server Site B

System Monitor/Test Value Proposition

- **Provide shared situational awareness for GIS support roles that may not typically have access to server infrastructure and associated monitoring software managed by IT organization**
- **Complement monitoring tools used by the IT organization. Simplify cross correlation of GIS domain specific settings, platform infrastructure resource constraints and/or events, and user load**

System Monitor/Test Value Proposition

- **Provide empirical basis for tuning service configuration and underlying resource requirements to maximize overall system performance while taking into consideration:**
 - **System memory and CPU resources**
 - **Number of Services**
 - **Min/Max instances per service**
 - **Individual service complexity (resources required per running instance / web request)**
 - **Service criticality, usage patterns and load**
- **Auditable logs to document SLA compliance and support formal service onboarding process**

System Monitor/Test Value (cont.)

- **The availability for both the GIS and IT teams to System Monitor KPI can help isolate the ‘signatures’ associated with adverse conditions associated with resource constraints, improper configurations, or component failures. This in turn can translate into:**
 - **Timely decision support to enable anticipation of and/or rapid response to events**
 - **Standardized and simplified role based procedures (SOPs) and situational responses.**
 - **Expedited identification of the appropriate change requests and support ticket items based on empirical, thresholds, and alerts.**

System Test - Standard Procedure for Onboarding GIS Services

- **Services are worked collaboratively between the content sponsor and the GIS support team on the Development Tier where cartography, data ingestion, and required service capabilities are defined.**
- **Service configurations graduate to the QA site where the service catalog mirrors the Production site(s). Once deployed on the QA site the service is subjected to load testing using the System Test application.**

System Test - Standard Procedure for Onboarding GIS Services

- **Service specific System Monitor KPI collectors are configured**
- **If test results are acceptable they are entered as benchmark artifacts in the program CM repository and the service is queued for Production.**

System Test - Standard Procedure for Onboarding GIS Services

- If unit test performance is not acceptable in terms of response time, code, and content; further analysis is performed to isolate problematic layers, cartographic configurations, or underlying RDBMS queries.**
- This may include leveraging additional tools such as mxdperfstat and/or PerfQAnalyzer.**

System Test – Results as CM Artifacts

| 100 | 14.083 | 9.774 |

Transactions/Sec vs. Step Load

Transactions/Sec @ nco-vs-gismgmt1

| Step Load | Avg. Value | Std. Deviation |
|-----------|------------|----------------|
| 60 | 29.008 | 11.093 |
| 80 | 30.591 | 7.048 |
| 100 | 35.965 | 9.237 |

Testing and Monitoring of GIS Server(s) – Test Scenarios

- **Normal operation under simulated load**
- **Shutdown and start up of one or more read only slave(s)**
- **Failover to warm stand by master**
- **Shutdown / restart up of one or more GIS servers**

Testing and Monitoring of GIS Server(s)

- **Initial KPI and Thresholds – RDBMS Server(s)**
 - **HTTP collector for selected services**
 - Response Time > 2 seconds (will vary)
 - Response Code \neq 200
 - Response Length (will vary)
 - **System**
 - CPU > 70%
 - Memory > 80%

Testing and Monitoring of PostgreSQL RDBMS HA Cluster Test Scenarios

- Normal operation under simulated load
- Failover to warm stand by master
- Shutdown of one or more read only slave(s)
- Addition or start up of read only slave(s)

Initial KPI and Thresholds – RDBMS Server(s)

- **Processor utilization > 70%**
- **Memory utilization > 80% of physical**
- **Storage utilization > 80% of storage capacity**
- **Average Disk Seconds / Read > 10ms**
- **Average Disk Seconds / Write > 10ms**

- Data scripts/processes run against configuration tables in RDBMS that define groups of servers concurrently updating specific sets of source data
- Each process logs process/status metrics to the 'cluster' table every 60 seconds

Data Ingestion Process Description

- **System Monitor can in turn be configured with DB/Query counters against ingest process tables to track data ingestion process status and associated resource usage.**

Monitoring of Data Ingestion Processes - Scenarios

- **Compute Node shutdown (one and/or all)**
- **Unexpected shutdown/exception in data ingestion program/process**
- **Master database failover to warm standby**
- **Missing data in common data repository**

Monitoring of Data Ingestion Processes - KPI

- **Compute Node(s) overall CPU, memory**
- **Number of running data ingest processes**
- **Number of RDBMS connections (master)**
- **For each data ingest process:**
 - **Process run status**
 - **Server CPU, memory**
 - **Process memory**
 - **Time elapsed since last data update (in units as configured for that data source)**
 - **Number of features/images added and/or deleted during the last update**
 - **Available disk space on 'data staging' folders/mounts**

Looking Forward

Continue refinement of KPI's, thresholds, and alerts

- **Continue tuning service performance based on KPI findings**
- **Isolate and document KPI event/condition 'signatures' and identify appropriate responses, procedures, CR's and support tickets, etc.**
- **Identify appropriate integration points with NCO's existing monitoring/alerting systems and associated response protocols**
