RSM Online Project Databases

- RSM = Regional Sediment Management
 - ▶ Managing sediment to benefit a region potentially saves money, allows use of natural processes to solve engineering problem.
 - ▶ Web databases allows RSM teams to efficiently store, access, and share data between USACE Districts and non-Corps stakeholders.
- In 2006 USACE's North Atlantic Division was charged with the task to develop a technical review of coastal projects to present the current condition, estimated federal future costs, and opportunities for action.

Data Access

- To present the digital data needed for the technical review, the RSM Project Database was created: <http://projects.rsm.usace.army.mil>
- The Regional Sediment Management (RSM) databases provide an archive for data to support many of the RSM initiatives.
- Currently the RSM Database website supports Shore Protection, Navigation, and Sediment Manager projects.
- Public Access (password required for non-USACE users)

Welcome

The Regional Sediment Management (RSM) databases provide an archive for data to support many of the RSM initiatives. Each of the database listed below contain a geographic reference per project. This information is available for download in a Google Earth format (kml).

Use the list to the left to filter project databases by location, or access the links below to view all projects per database:

- [Shore Protection Projects](#)
- [Navigation Projects](#)
- [Sediment Manager Projects](#)

Public access to these databases is permitted, however a password is required to view the data.

What is Regional Sediment Management?

In the past, the US Army Corps of Engineers (USACE) has focused on managing sand at coastal projects on a project-by-project basis. This approach to sand management may not adequately consider the impact of individual projects on down drift projects. To address this issue, the USACE has initiated efforts to assess the benefits of managing sediment sources as a regional scale resource rather than a localized project resource. The concept of Regional Sediment Management (RSM) is a result of the 67th meeting of the Coastal Engineering Research Board (CERB) held in May 1998.

Local intranet 100%

Filter projects by location.

Shore Protection & Navigation Module

- ▶ Used by decision makers to gather an objective view on the condition of shore protection projects.
- ▶ Rated color coding allows stakeholders to quickly compare condition of projects in their area of interest.
- ▶ Users can view database details directly through the data access pages, or through “details” in Google Earth.

Project Locations: Spatial Data

- Currently the database that fuels the application extracts coordinate entries for project locations
 - ▶ Series of coordinate pairs for Shore Protection projects (polyline) and a single coordinate pair for Navigation project locations (point)
 - ▶ Initial data supplied by IWR and supplemented by RSM databases available in NAD and SAM.

Shore Protection Projects

Navigation Projects

Sediment Manager Projects

Available Google Earth Mapping Data:

- ▶ [Shore Protection & Navigation Projects](#)
- ▶ [USACE Districts \(NAN/NAP\)](#)

(Auto-generated GE KML)

Project Locations: Spatial Data

- ▶ Google Earth KMLs are generated on the fly and streamed to the user based on filtered content. E.g., All of New York District, or All projects in New Jersey.
- ▶ Phase II of the application will allow coordinates to be extracted directly from District's enterprise geodatabase (if available) and a public web mapping service will be hosted to be consumed by other enterprise mapping applications (e.g. CorpsMap, District eGIS, spatial data clearinghouses, etc.)

Sediment Manager Module

- Visually tracks dredge to placement locations for sediment projects.
- View basic level contract data together (Project Name, Contract Number, Bid Open Date, Cost, Start Date, End Date, Quantity Dredged, Quantity Placed, Material Type, and Material Source) with locations of dredging activities to placement sites.
- Auto-generated Google Earth KMLs are used in conjunction with geodatabase coordinates to plot locations in a mapping environment.
- Interested stakeholders can log into the site and request sediment or dredging activity for a selected area (using ESRI's Javascript API).

Sediment Manager Mapping

- If stakeholders are interested in having a designated area dredged or is in need of sediment, a request can be made from the Sediment Manager module.
 - ▶ Site is CAC-enabled.
 - ▶ If user does not have a CAC, username/password is required for request submissions.
- Using ESRI's Javascript API, the user can outline the boundary of their area of interest and supply supplemental information for the activity request.
- USACE Project Manager can review the request, view the boundary (auto-generated KML is created), and make comments back to the requestor.

- by RSM State
- by USACE Coastal District

Future of RSM Project Maps

- In addition to Google Earth, all location data for placement, dredge, and sediment request areas will be available through a WMS.
 - ▶ An inventory of available web services will be available on the RSM Project Database website.
 - ▶ The web services will connect to a District's geodatabase to retrieve the authoritative boundaries of disposal and placement areas.
- The RSM Project Database will consume data currently stored in existing USACE enterprise sources related to coastal engineering.
