

Abstract

The 2000 Census School District Special Tabulation

Track: Census and Geo-Demographics

Author(s): Douglas Gevert

This presentation discusses the 2000 Census school district tabulation (STP-2), a data set designed by the Census Bureau to facilitate demographic and geographic analyses of public school systems in the U.S. This unique data source offers more than 100,000 demographic characteristics for each school district in the U.S., and it offers the largest source of children's demographics available from the 2000 Census. The inherent spatial attributes of this special tabulation make it uniquely suited for GIS users interested in educational analyses or researchers interested in visualizing the spatial distribution of children's demographics.
