Mississippi Pollutant Point Source Location Project Using ArcPad

Track: State and Local Government

Author(s): Gary Hennington, Greg Jackson, Daryl Cook

Managing the environmental impacts of human influence on surface waters for the state of Mississippi includes the monitoring of many different sources. One important source of pollution is Publicly Owned Treatment Works which discharge treated wastewater to the surface waters of the state. This project designed a field collection procedure utilizing an ArcPad interface for field collection specialists to survey and verify all of the permitted point source discharge locations in the state.
