Defining Centerline Standards for County Government Applications

Track: State and Local Government

Author(s): Todd Brenningmeyer

One of the challenging aspects of providing detailed geographic data sets is connecting the desires of the client with a defined standard that will meet project needs. In the case of centerline collection, there is unfortunately no defined photogrammetric standard that can adequately meet the needs of all users. Issues such as feature generalization and methods of attribute assignment heighten the complexity of this particular feature type and require a very close definition of end user needs. This paper discusses the successful collaboration of a data provider and user to define a standard for centerline collection.
