## **Enhancing Farm Management and Records With GIS**

**Track:** Agriculture

**Author(s):** Jonathan Norvell, Quentin Rund

GIS data, like all information, is not, by itself, necessarily useful or profitable. The organization, analysis, and form of the information are often as critical in determining its usefulness as the information itself. Currently, the farmer with a GIS experiences inefficiencies in collecting, sorting, organizing, and analyzing data into a useful form. However, a GIS can be an effective means for organizing, analyzing, and communicating farm data. This presentation outlines the typical steps a farm manager must take to build and implement a useful farm data set.
