

# Abstract

## **Integrating Parcels: The Final Step in the National Integrated Land System (NILS)**

**Track:** Federal Government Systems

**Author(s):** Leslie Cone

The U.S. Bureau of Land Management and the U.S. Forest Service's National Integrated Land System (NILS) project of providing a total business solution for the integration of field survey data with parcel data is becoming a reality. Three out of four modules have been completed: GeoCommunicator, Survey Management, and Measurement Management. The final module, Parcel Management, will provide tools for the creation and management of parcel features and the integration of those parcels vertically with survey-based land descriptions. NILS will also include customizable tools to manage workflows and tasks associated with parcel and survey management that will revolutionize the way BLM does business.
