RSIMS: A Regional Commander's Decision Support Tool

Track: Federal Government Systems

Author(s): Peter Len

The Regional Shore Installation System, or RSIMS, is a portal-based facilities management tool that allow Navy Regional Commanders to make informed decisions about issues and operations affecting their shore installation environment. Electronic tools in RSIMS, some of which are GIS based, are used to answer the three major questions asked by a Regional Commander: What are my assets? Where is my money being spent? Where do I need to spend my money? RSIMS has been deployed in multiple regions throughout the Navy and are being used daily by Navy military and civilian personnel to help them answer questions to do their respective jobs.
