Abstract

Converting Legacy Data: ArcScan vs. Digitizing
Track: Database Design, Automation, and Management
Author(s): Julie Henry, Aine McAlister

The South Central Coastal Information Center, located at the Cal State University, Fullerton Department of Anthropology, is the regional repository for the California State Office of Historic Preservation. Currently, the data is drawn on USGS topographic maps and Mylar overlays. ISSI is investigating various methods to extract historic data from these maps using two methods: ArcScan and Digitizing tablet. The aim of this project is to create three vector historic layers suitable for use in a GIS.
