

GIS in Support of Detailed Flood Modeling

Gilder Creek Watershed Study

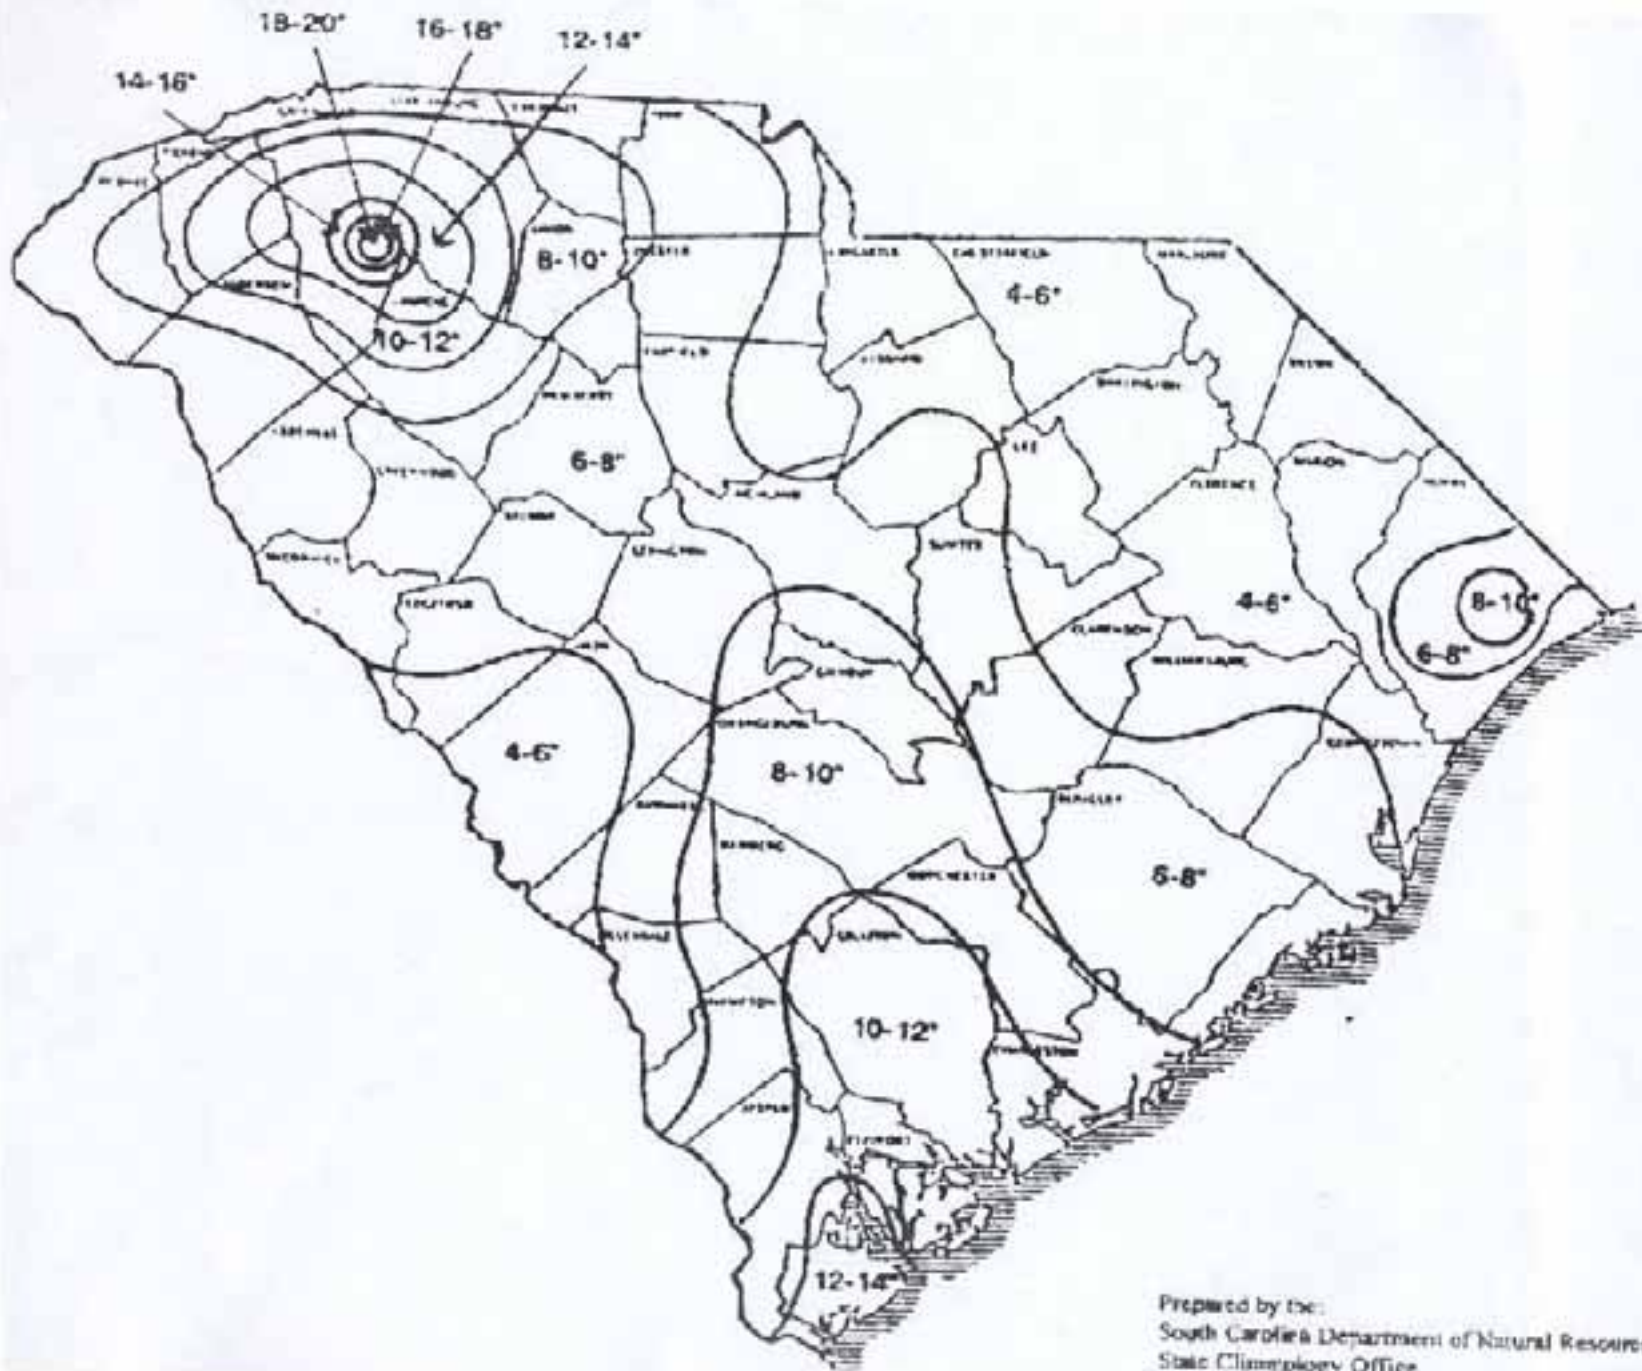

Greenville County, SC

Woolpert

Tropical Storm Jerry

Prepared by the:
 South Carolina Department of Natural Resources
 State Climatology Office
 (Updated August 29, 1995)

Not your everyday storm...

2-inches
Summer
Thunderstorm

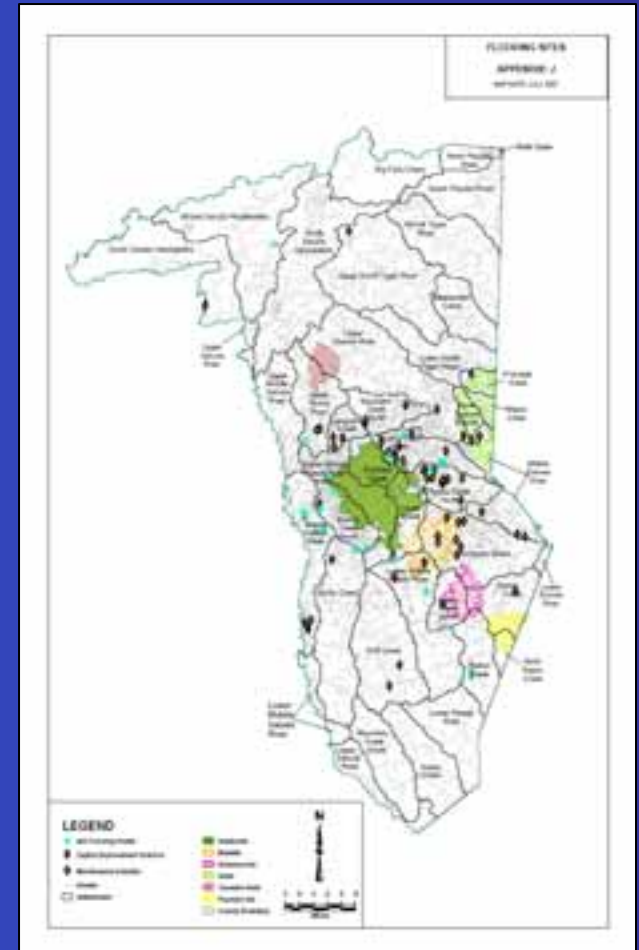

9.45-inches
100-year
Storm

18-inches
TS Jerry

Study Purpose

- Identify flood prone structures and develop potential alternatives to reduce flooding damage
 - Develop hydrologic and hydraulic models
 - Prepare accurate floodplain mapping
 - Identify potential capital improvement projects to reduce and/or prevent future increases in flooding

GIS Usage Throughout Study

- Field Data Collection
- Development of Modeling Input Data
- Model Creation
- Model Verification and Calibration
- Display of Modeling Results

Field Data Collection

Stream Walks

- Field crews walked 67 miles of streams to collect the following:
 - Channel/pipe measurements
 - 1,800 cross sections
 - Digital pictures
 - Estimates of channel resistance (i.e. vegetation, trees, channel bends)

Bridge/Culvert Survey

- Surveyed a total of 141 culvert and bridge crossings

Residential Structure Survey

Development of Modeling Input Data

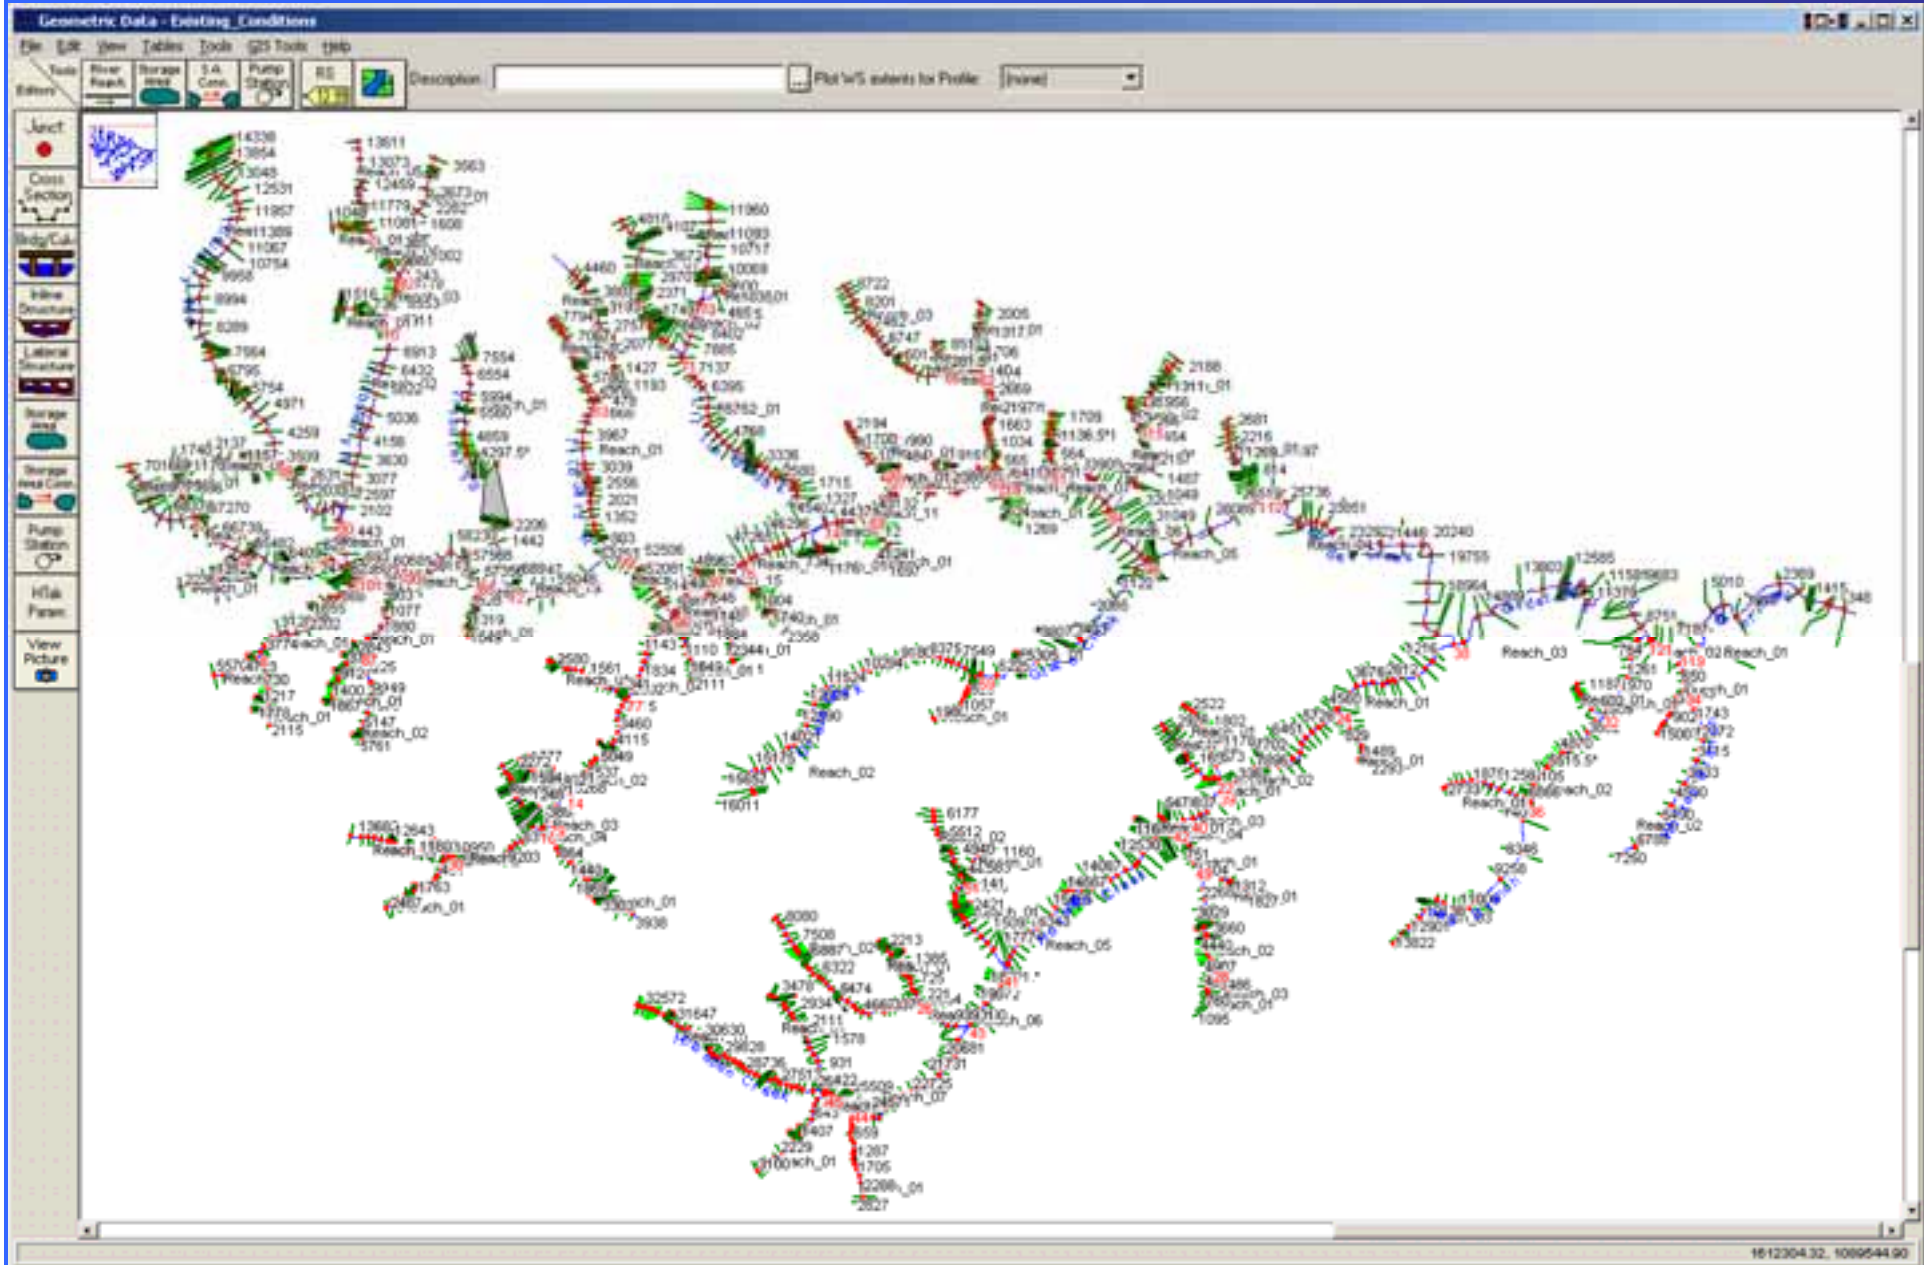

Arc Hydro

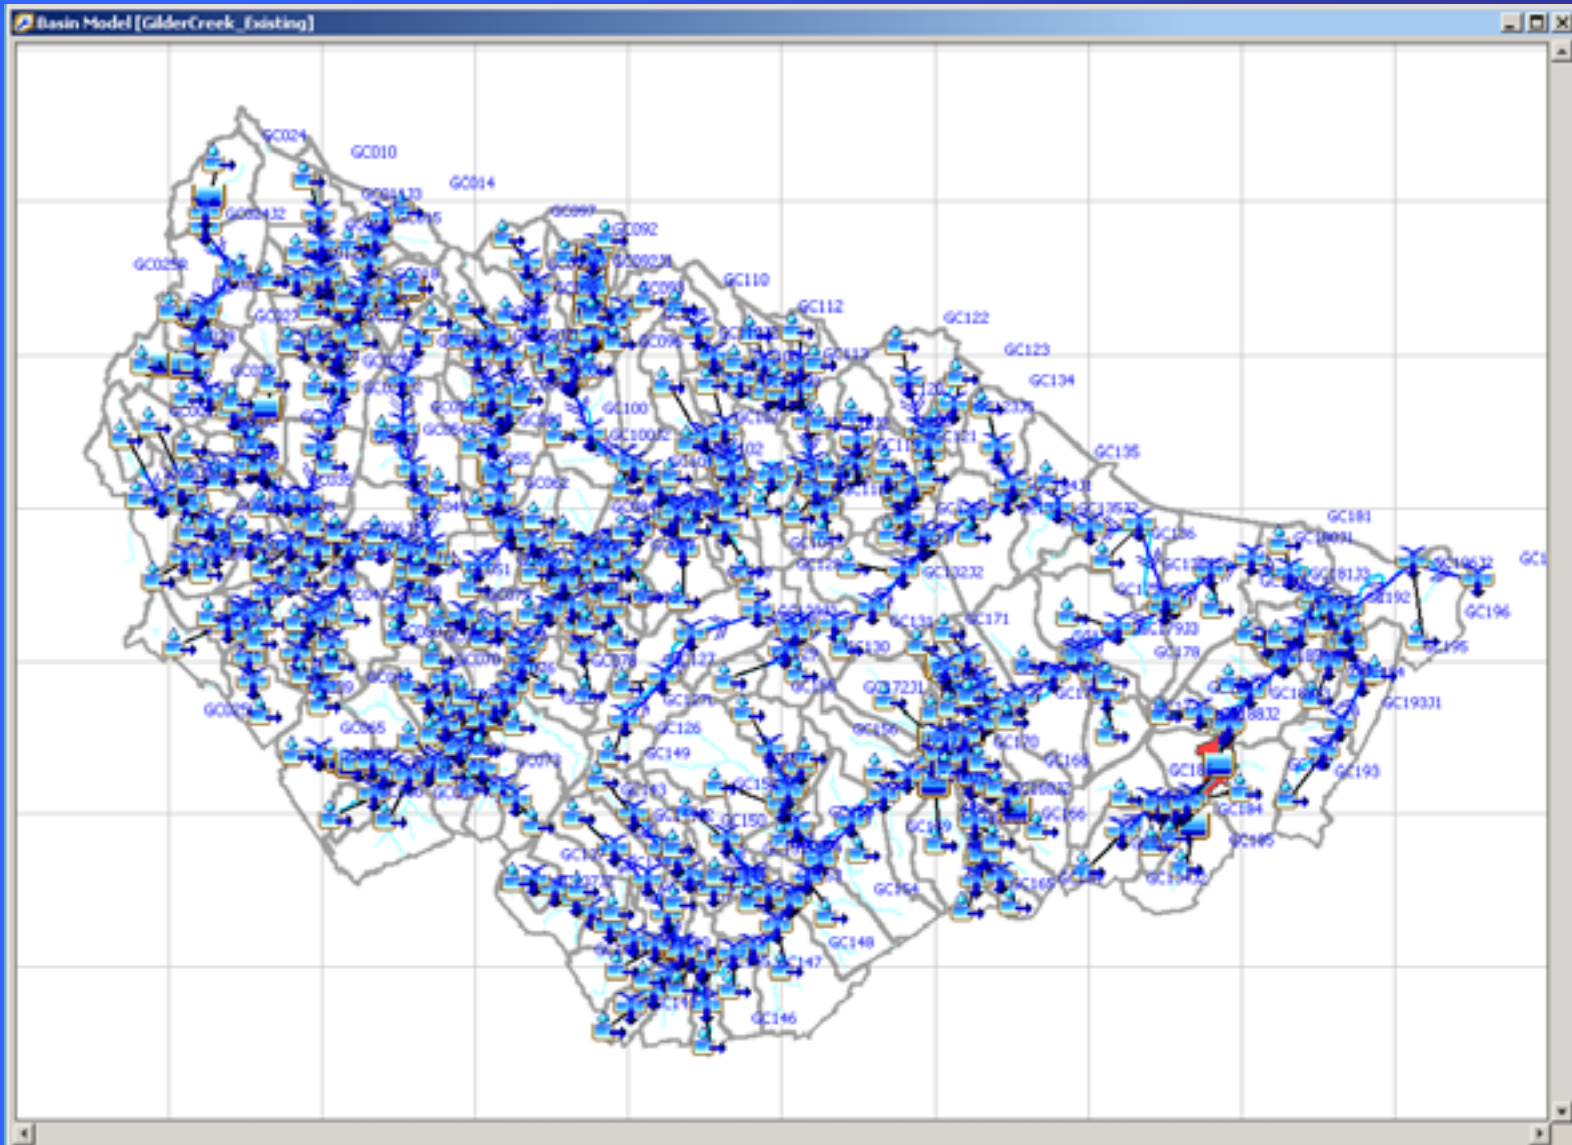

Model Creation

HEC-GeoRAS – HEC-RAS

HEC-GeoHMS – HEC-HMS

Hydrologic Modeling

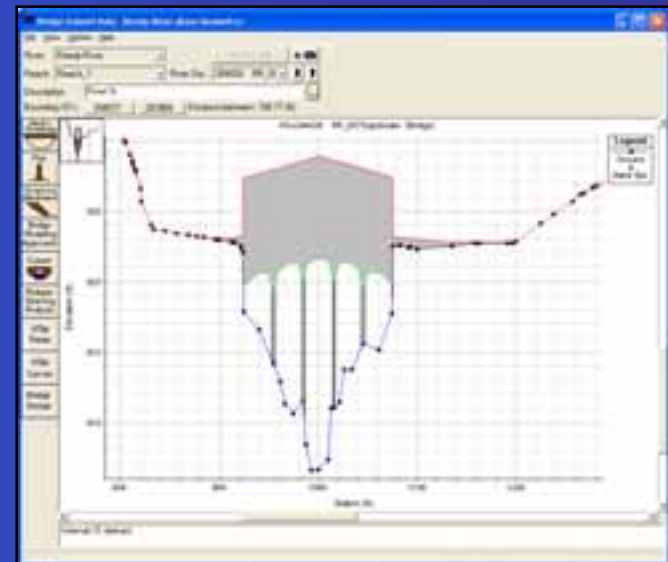

- Divided the basin into 196 sub-watersheds to predict the amount of storm water runoff during rainfall events using:

- Drainage area
- Soils
- Landuse

Hydraulic Modeling

- Predicted water surface elevations using the following:
 - Bridge/culvert survey data
 - Runoff predicted from hydrologic modeling
 - Channel and floodplain geometry
 - Channel slope
 - Channel resistance (i.e. vegetation, trees, channel bends)

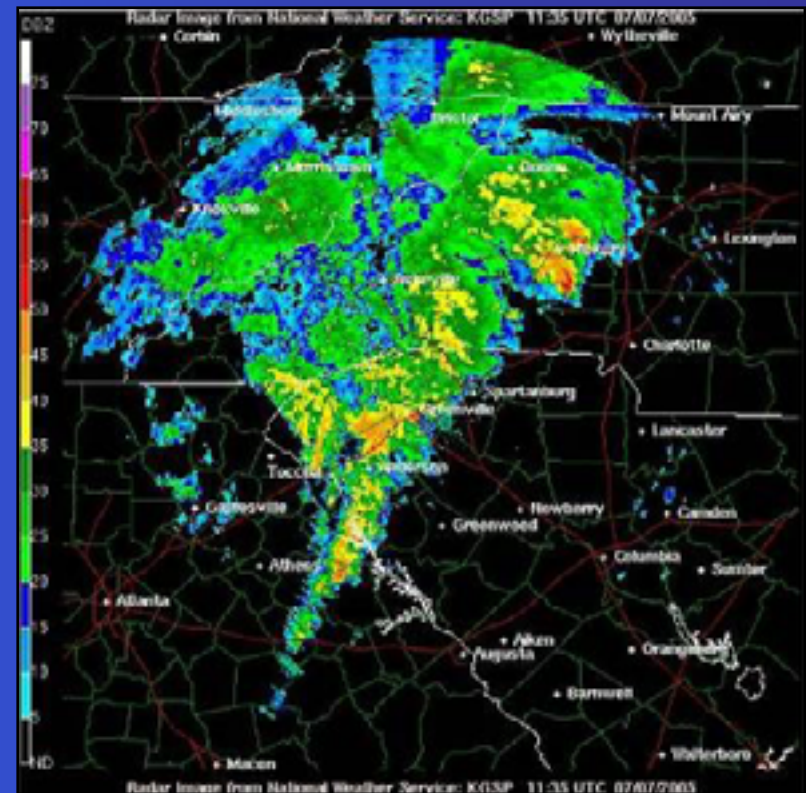

Model Verification and Calibration

High Water Marks

Model Validation

- Obtained NWS historical rainfall data where available
- Received pictures and documentation of historical flood events
- Selected TS Jerry (Aug '95) and **July '05 storms** for validation

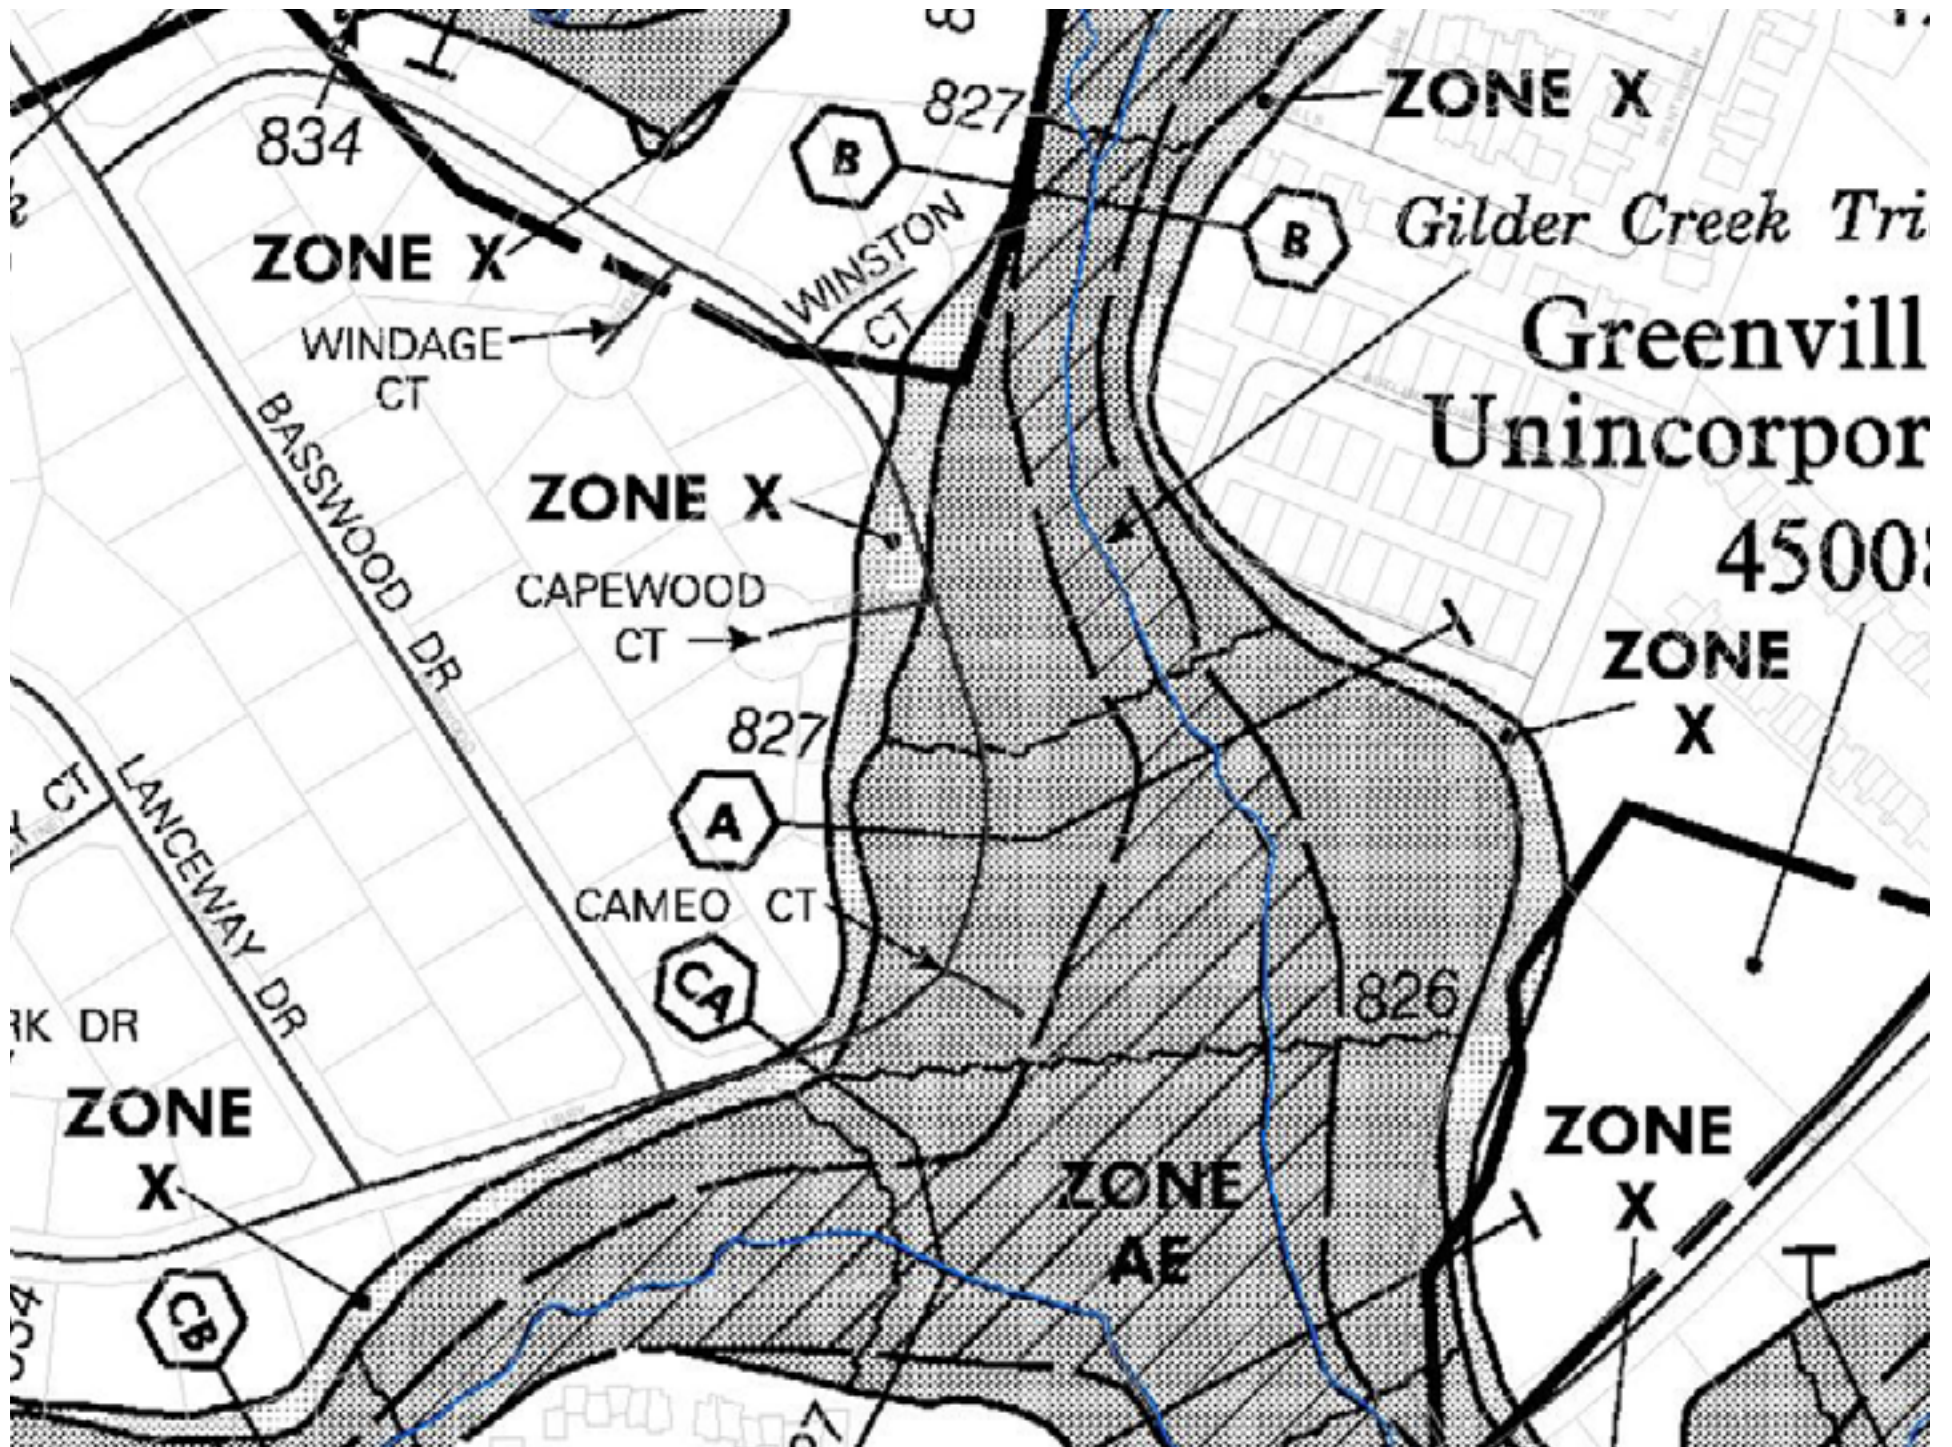

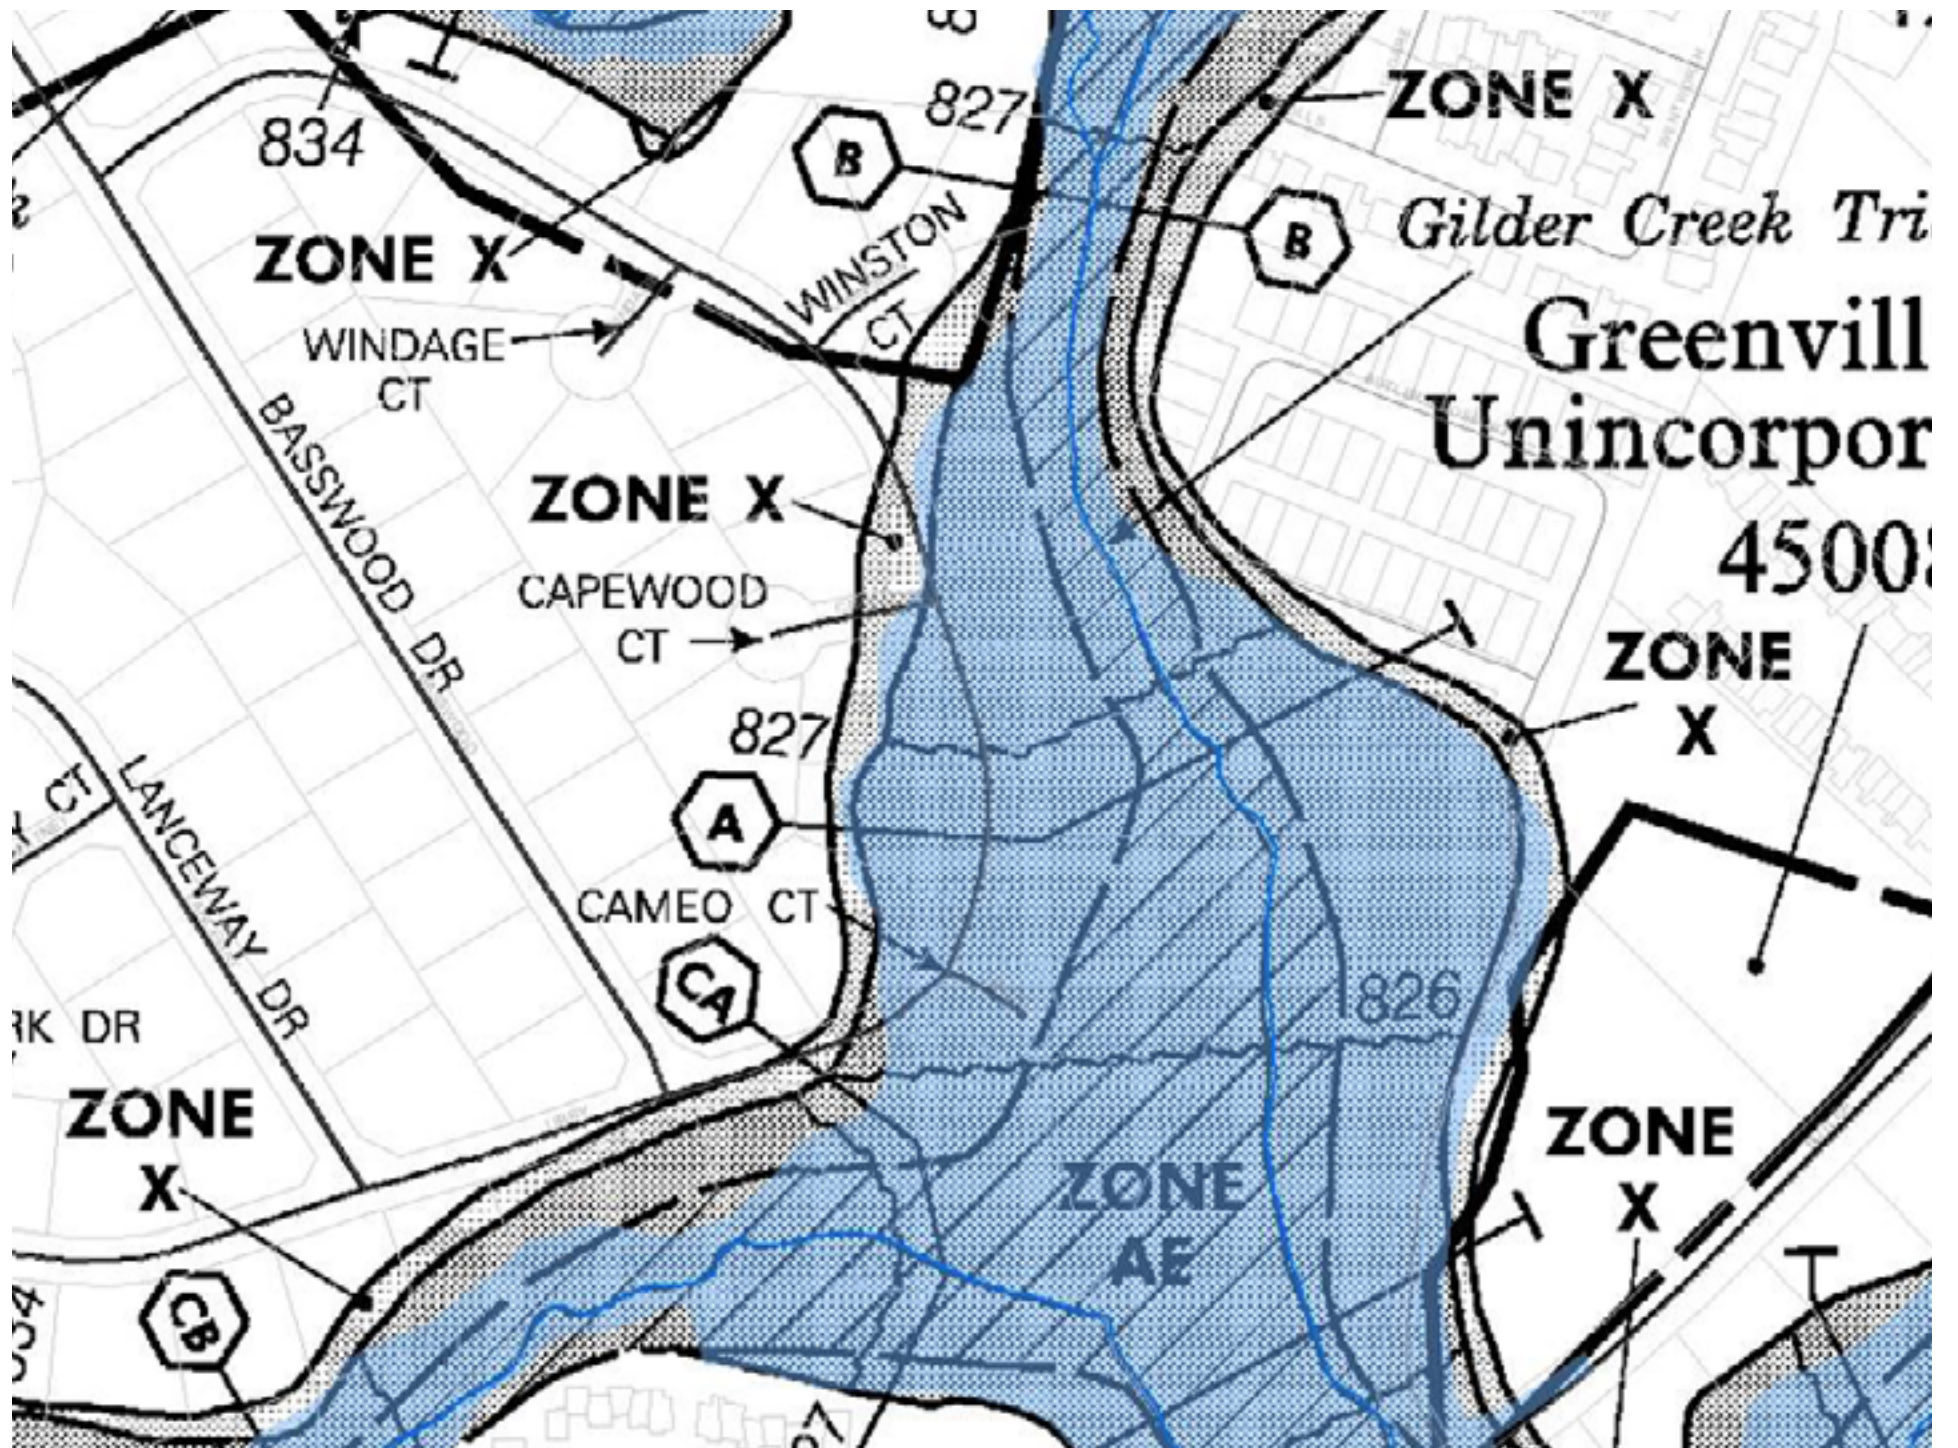

Final Validation

- Matched HWMs within 0.2 -1.0 feet
- Model inputs provide representative results for other events

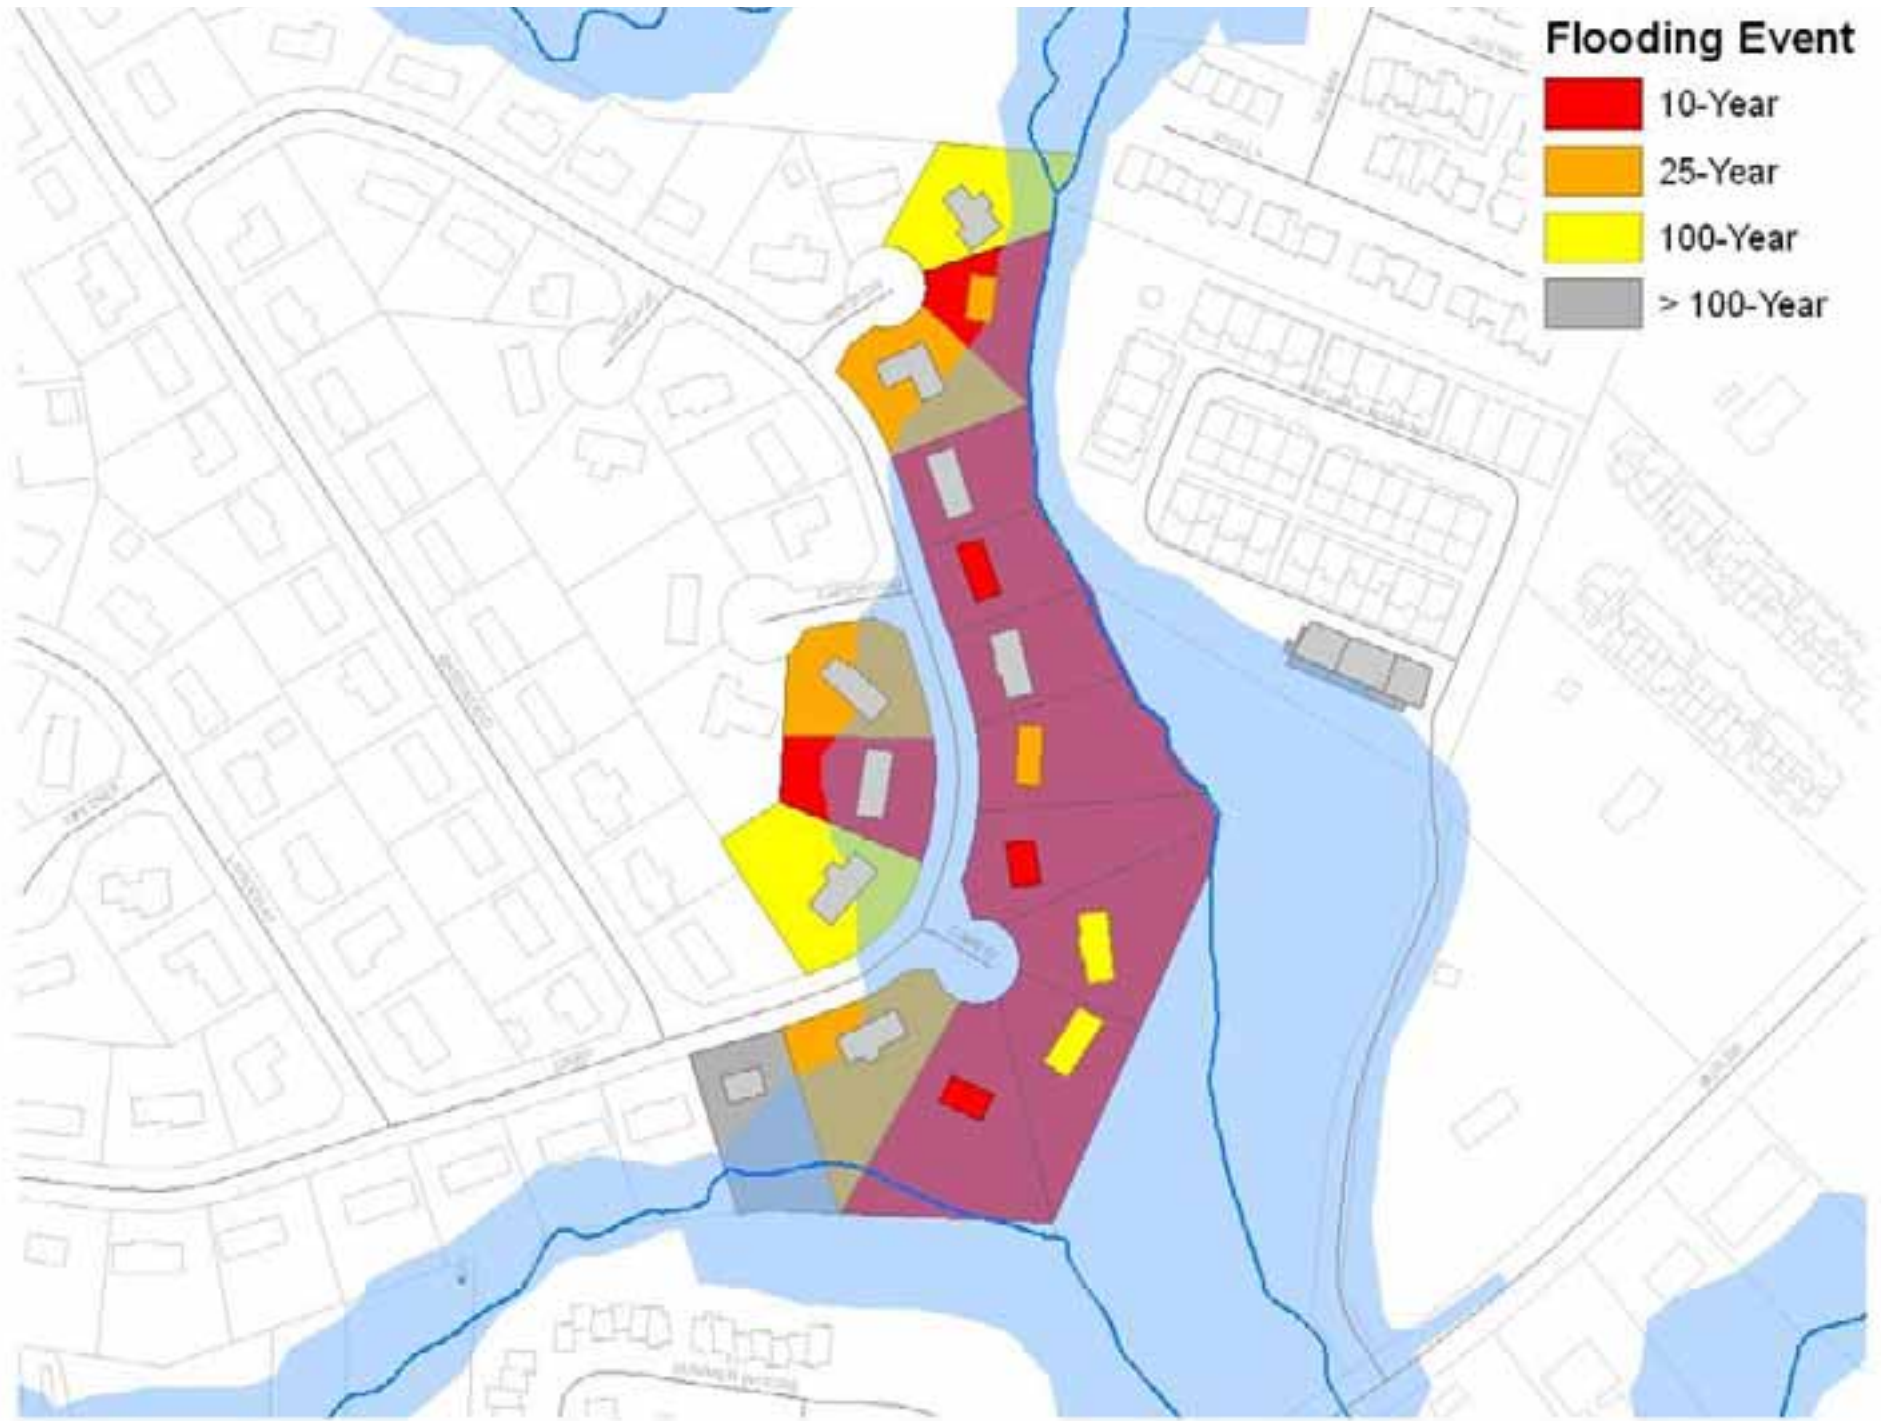

Display of Modeling Results

Neighborhood Flooding

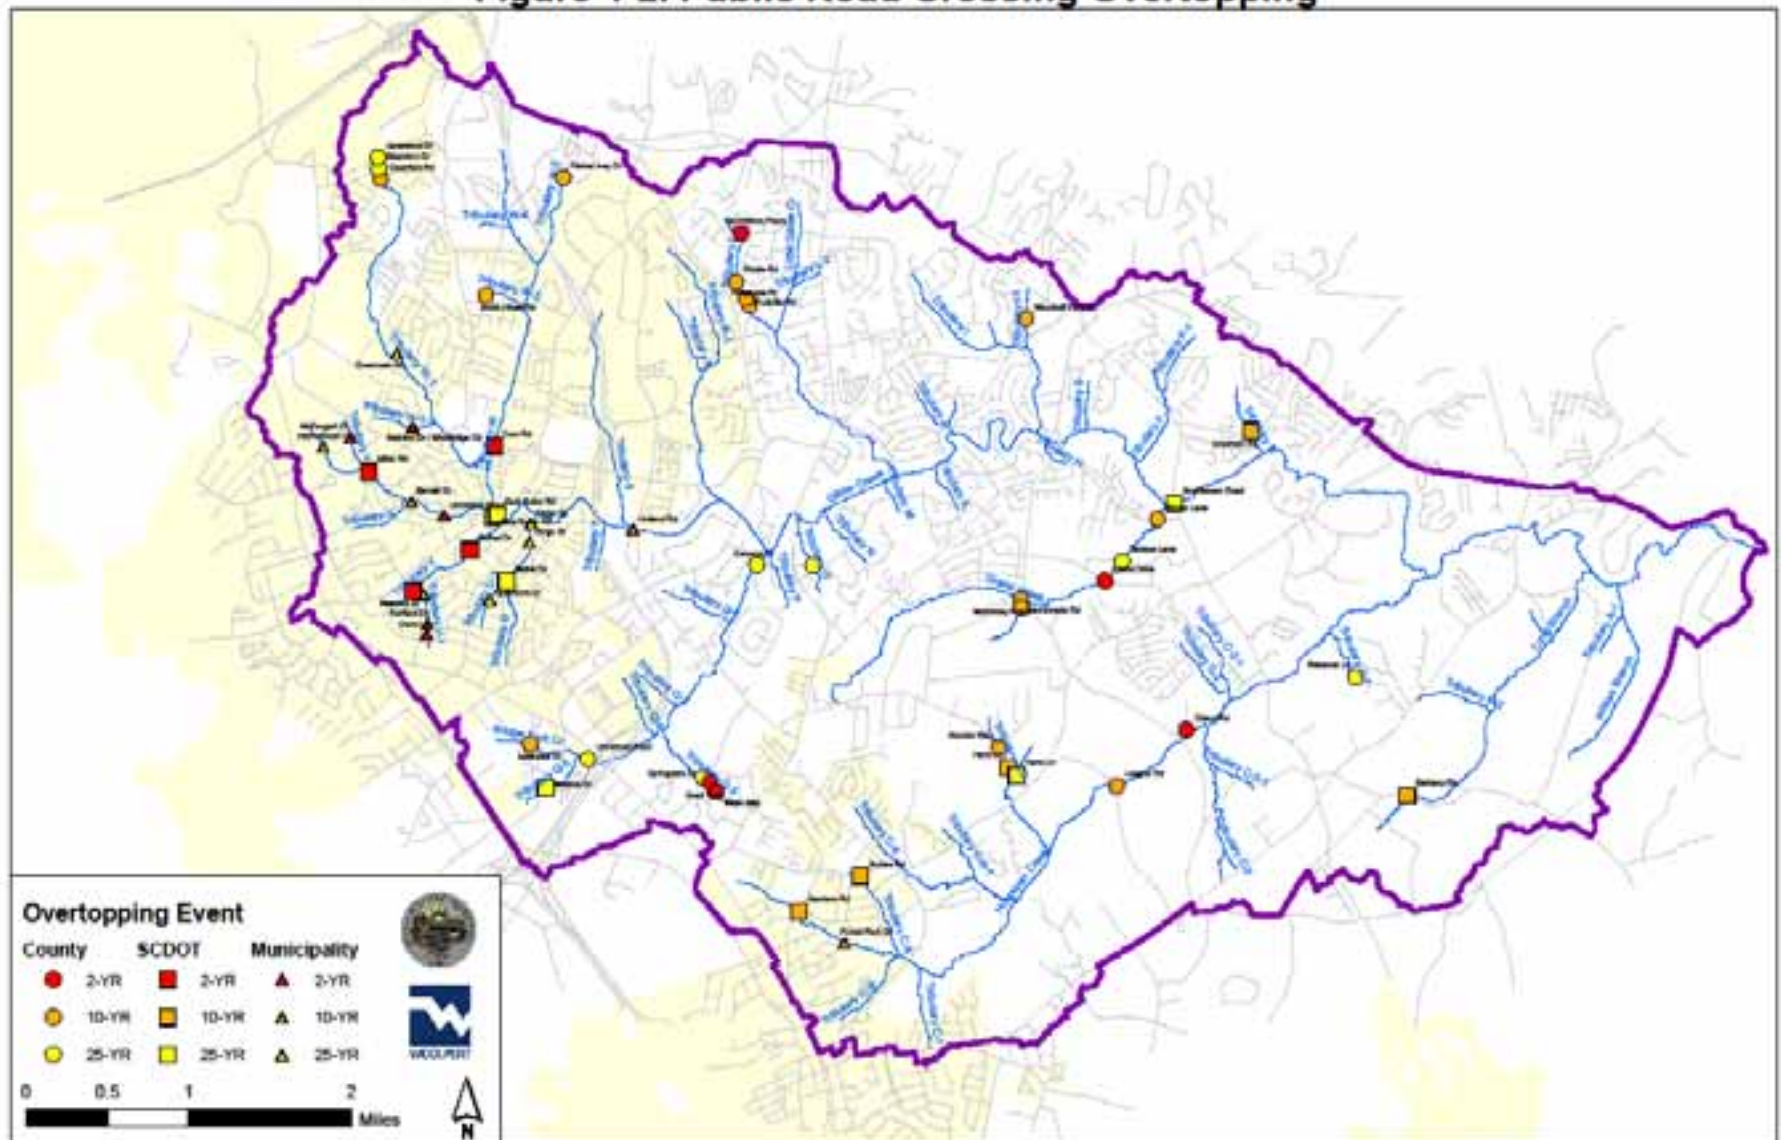

Figure 4-2. Public Road Crossing Overtopping

Results

- Yard flooding
- Culvert/bridge overtopping
 - 8 County roads (2-year storm)
- Structures at risk during flooding
 - 30 homes (100-year storm)

Alternatives Analysis

- Based on initial evaluation, typical capital improvements such as regional detention, large scale channel improvements, diversions, or flood walls will not solve the problem
- Analysis will focus on more localized solutions such as:
 - House-by-house solutions
 - Culvert/bridge upgrades
