# Mission

The Arnold Arboretum of Harvard University discovers and disseminates knowledge of the plant kingdom to foster greater understanding, appreciation, and stewardship of Earth's botanical diversity and its essential value to humankind.

# History of GIS at the Arboretum

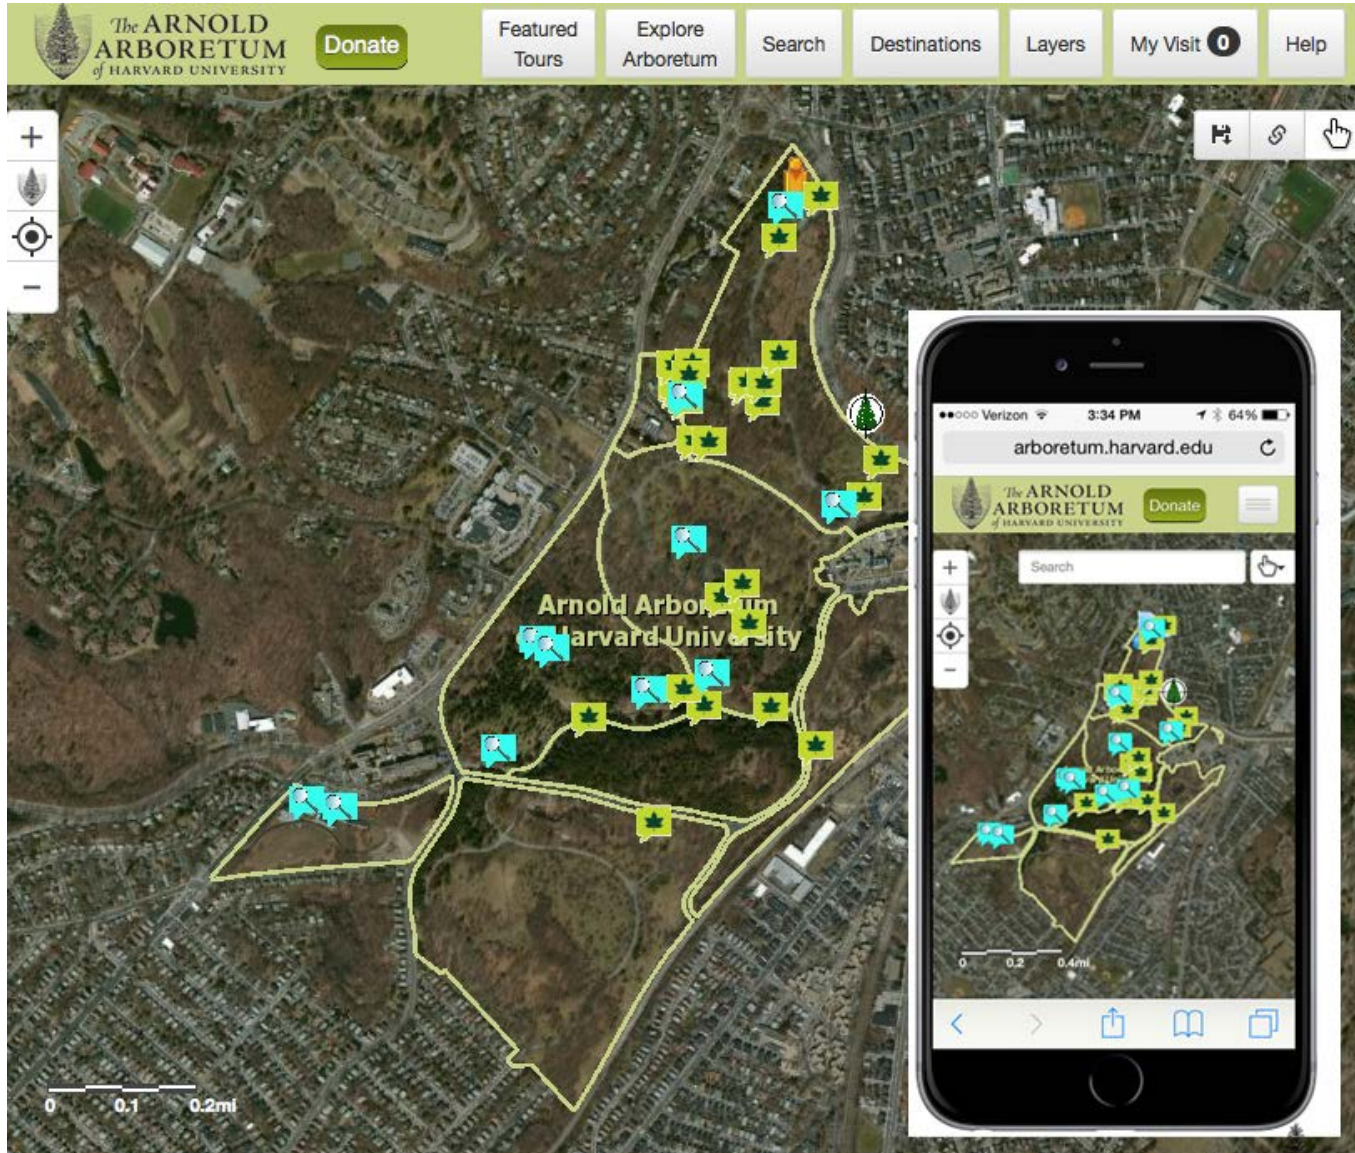

- 1887, Henry Sargent Codman, Sargent's cousin, made the first map documenting the location of accessioned trees at the Arboretum
- Since the 1990s, staff have captured coordinates for all accessioned plants using Global Positioning System (GPS) technology.
- Today, the Arboretum utilizes a suite of ESRI Desktop and Mobile GIS software applications to manage, analyze, query, capture, manipulate, and display geographic information.
- Decimeter accurate field mapping of landscape features (e.g., plants, benches) is accomplished using a Trimble Geo 7X, with rangefinder, connected to a Zephyr Model 2 antenna.

Archival map of the Peters Hill Natural Woods drawn in 1985. Almost 1800 flat files of our archival maps have been scanned and georeferenced and added to our GIS (maps from the 1930s to 1980s).

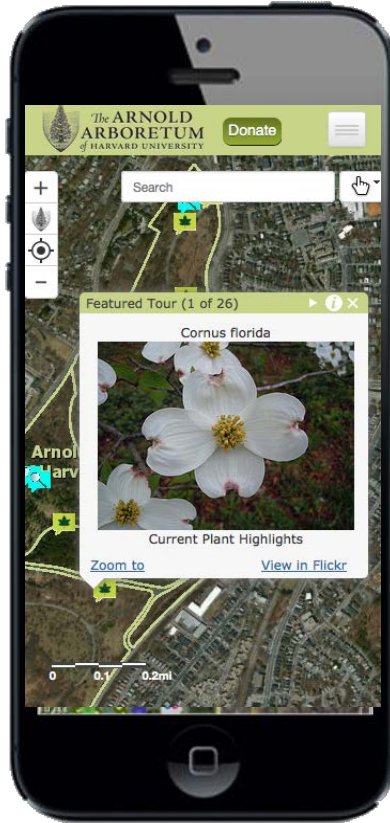

# Arboretum Explorer

# The Technology

- The user interface is written using HTML5, JavaScript, [AngularJS 1.12.16](#), and [Bootstrap 3.2.0](#)
- The mapping components are written using the [ArcGIS Server JavaScript API, version 3.13](#), which is built off of [Dojo 1.10.4](#).
- Our GIS data is available through [ArcGIS Server REST services](#)
  - e.g., [Phylogeny Layer](#)

# Data Sources

- ArcGIS Server Map Services
  - [ESRI World Imagery Map Service](#)
  - [Arnold Arboretum Imagery Map Service](#)
  - [Arnold Arboretum Collection Explorer Map Service](#)
- Arnold Arboretum Map Services
  - [CollectionExplorer Map Services](#)
    - [Plants by Phylogeny](#)
- Custom Feature Layer
  - [Arnold Arboretum Flickr Albums](#)
    - [Flickr Geotagged Photosets](#) (e.g., [Current Plant Highlights](#))

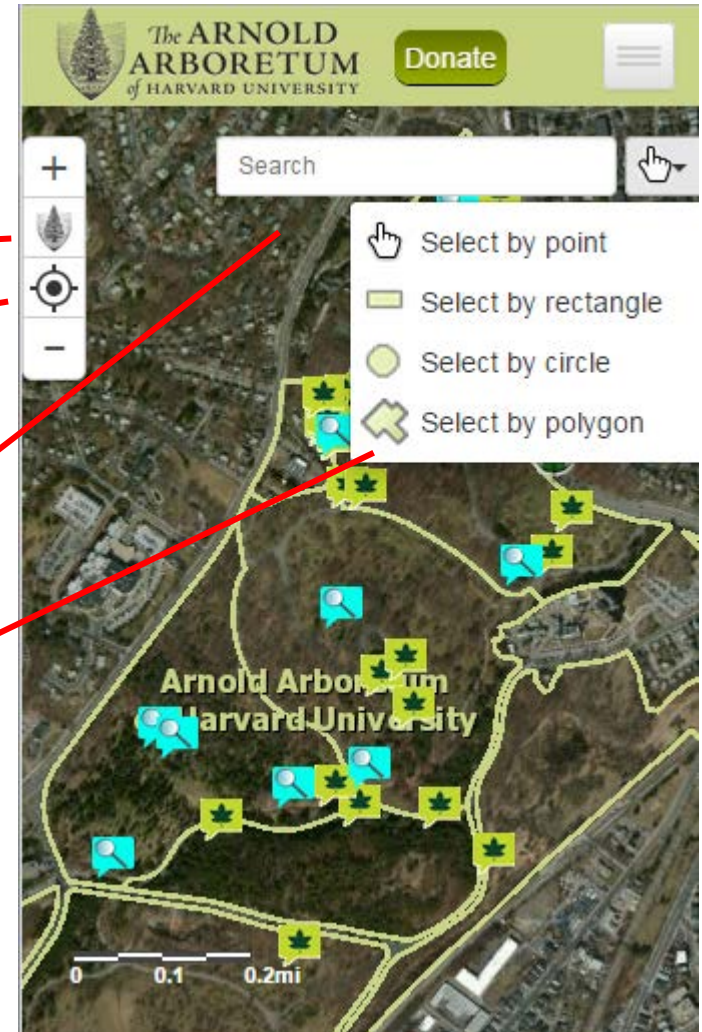

# Application

**Find Arboretum:** Centers the user's map to the location of the Arnold Arboretum.

**Zoom to User:** Centers the user's map to the user's current location.

**Quick Search:** Performs an attribute query against the Arboretum's plant data.

**Select Tools:** Allows the user to draw a shape on the map to select plants.

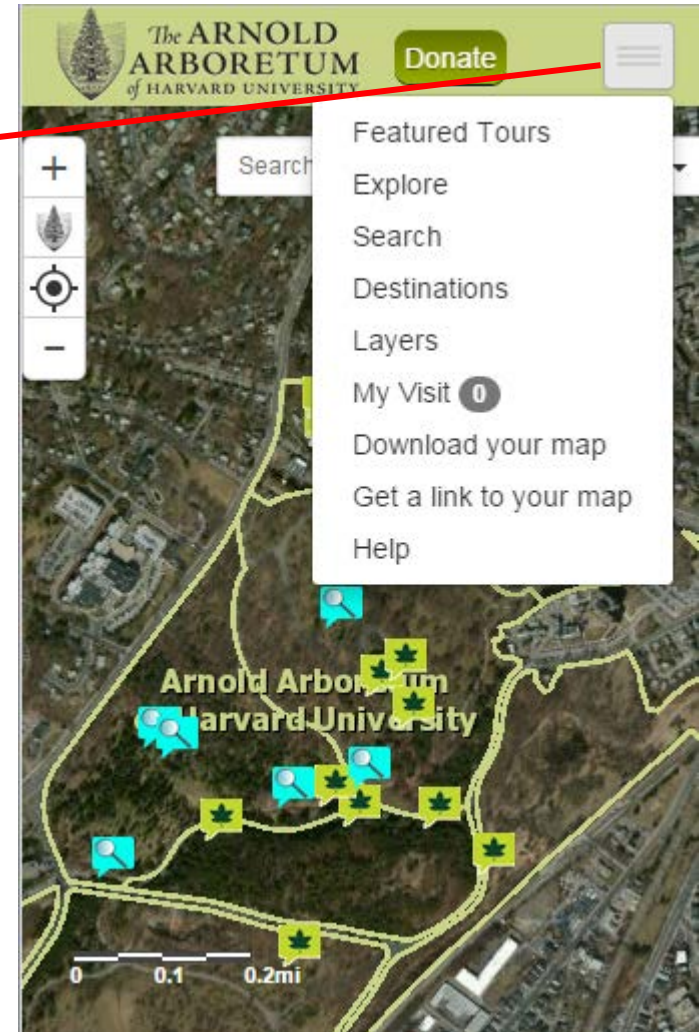

# Functions

**Menu:** Tapping the Menu button shows the user additional functions that are available in Explorer.

- Featured Tours
- Explore Arboretum
- Search
- Destinations
- Layers
- My Visit 0
- Download Map
- Link Map
- Help

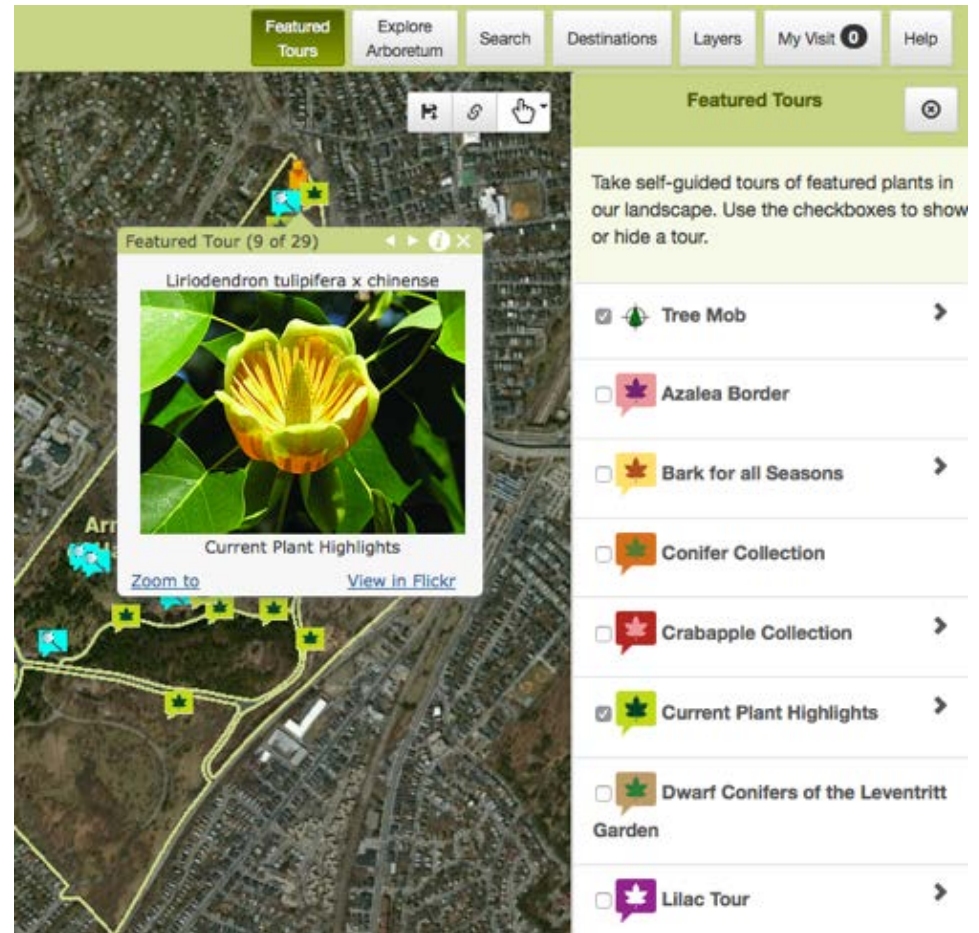

# Featured Tours

The Featured Tours in Explorer are geotagged photos from the Arboretum's Flickr account.

The Featured Tours layer is a custom feature layer written in PHP.

Turning on a tour will zoom the user to the extent of the tour.

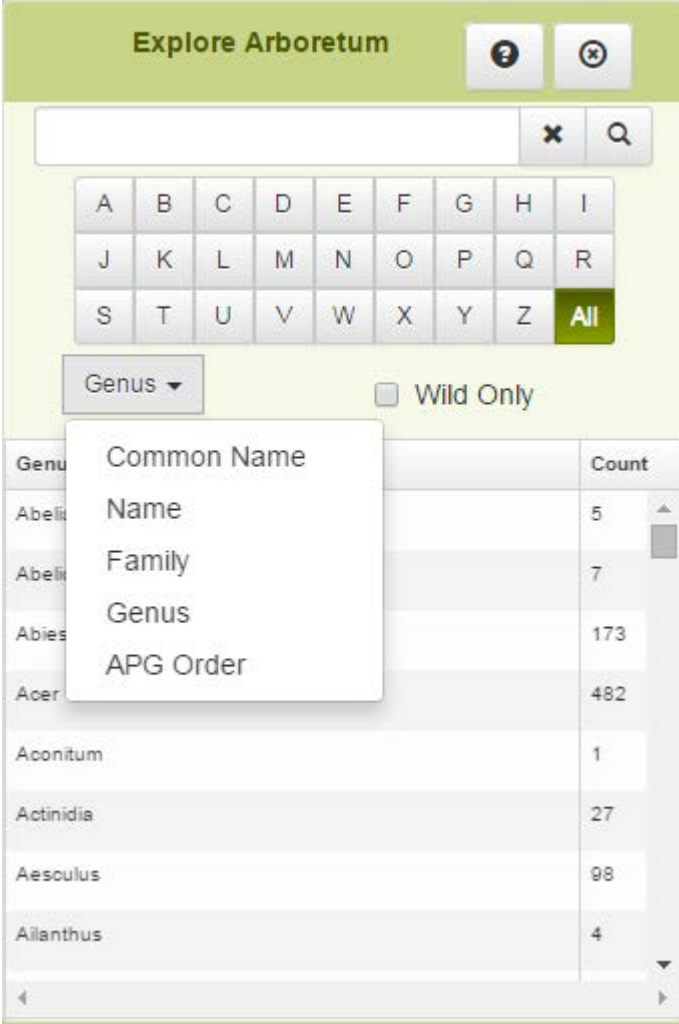

# Explore Arboretum

The Explore Arboretum function shows a list of plants keyed by a selected attribute in the Arboretum.

The plant list and counts are derived using ArcGIS Server Query Statistics services.

Clicking on a plant will highlight the plants on the map and zoom the user to the extent of the plants.

The screenshot shows the 'Explore Arboretum' web application interface. At the top, there is a title bar with the text 'Explore Arboretum' and two icons: a question mark and a close button. Below the title bar is a search bar with a magnifying glass icon and a close button. Underneath the search bar is a grid of buttons for letters A through Z, with the 'All' button highlighted in green. Below the letter grid is a 'Genus' dropdown menu and a 'Wild Only' checkbox. A dropdown menu is open from the 'Genus' dropdown, showing options: 'Common Name', 'Name', 'Family', 'Genus', and 'APG Order'. Below the dropdown menu is a table with columns for 'Genus', 'Count', and a scroll bar. The table lists the following data:

Genus	Count
Abel...	5
Abel...	7
Abies	173
Acer	482
Aconitum	1
Actinidia	27
Aesculus	98
Ailanthus	4

# Search

Users can perform a simple search, or, users can perform an advanced search.

The advanced search mode will allow users to specify values against individual fields using an AND operator.

Search Arboretum ? ✕

Advanced Search

Wild Collected Only  Exact Match

**Plant ID** ?  
e.g., 63-78\*A, 63-78

**Common Name** ?  
e.g., White Willow

**Scientific Name** ?  
e.g., Salix alba, Salix, alba

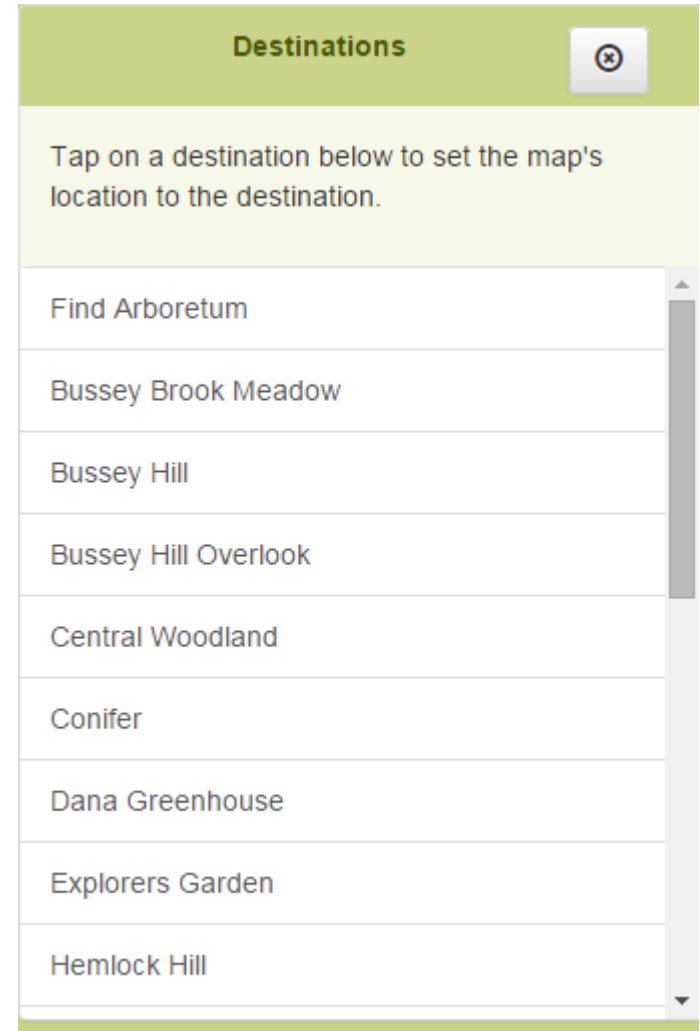

**Family** ?  
e.g., Salicaceae

# Destinations

The Destinations function presents the user with a list of areas within the Arboretum.

Clicking on a destination will zoom the user to the location of the destination.

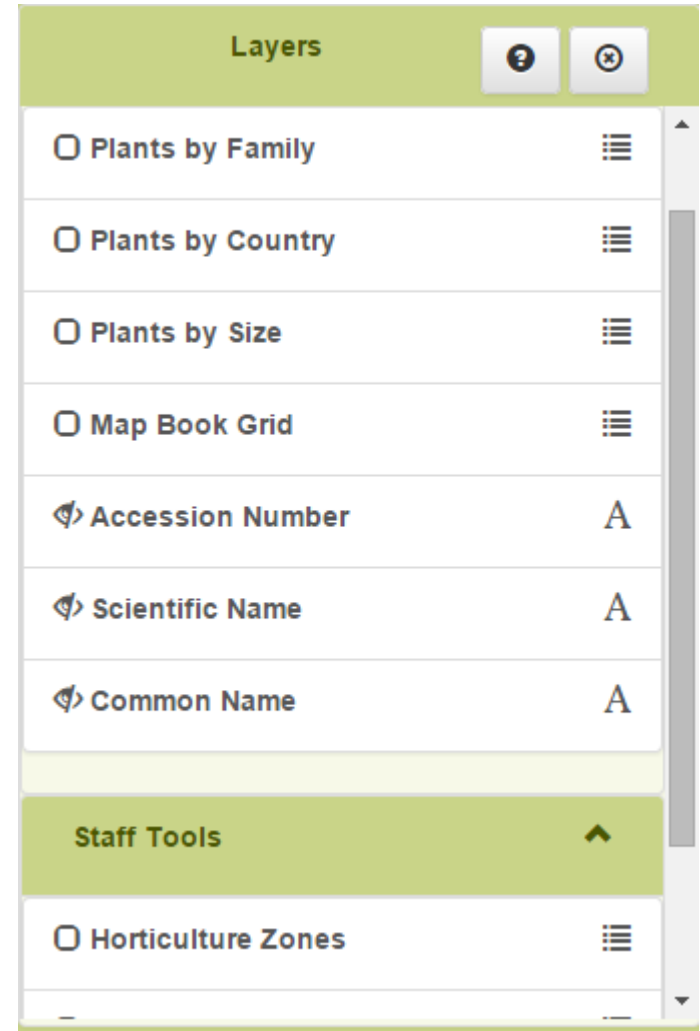

# Layers

Explorer uses a dynamic map service to show the various Arboretum GIS layers.

The Layers function allows a user to turn GIS layers on and off in the map.

The Layers function also allows users to turn labels on and off, and also provides a legend for the layers, if available.

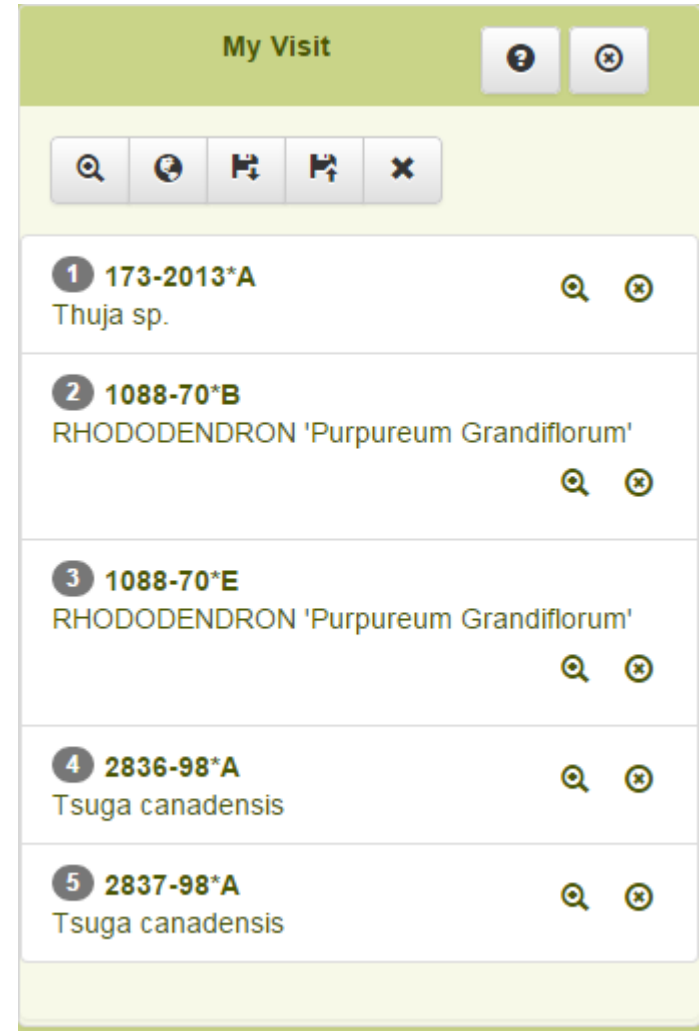

# My Visit

The My Visit function allows users to add selected plants to their own custom tour.

Users can reorder the plants in their visit by dragging the plants in the user interface.

Plants that are added to a visit will show when printing the map and when sending a link to the map.

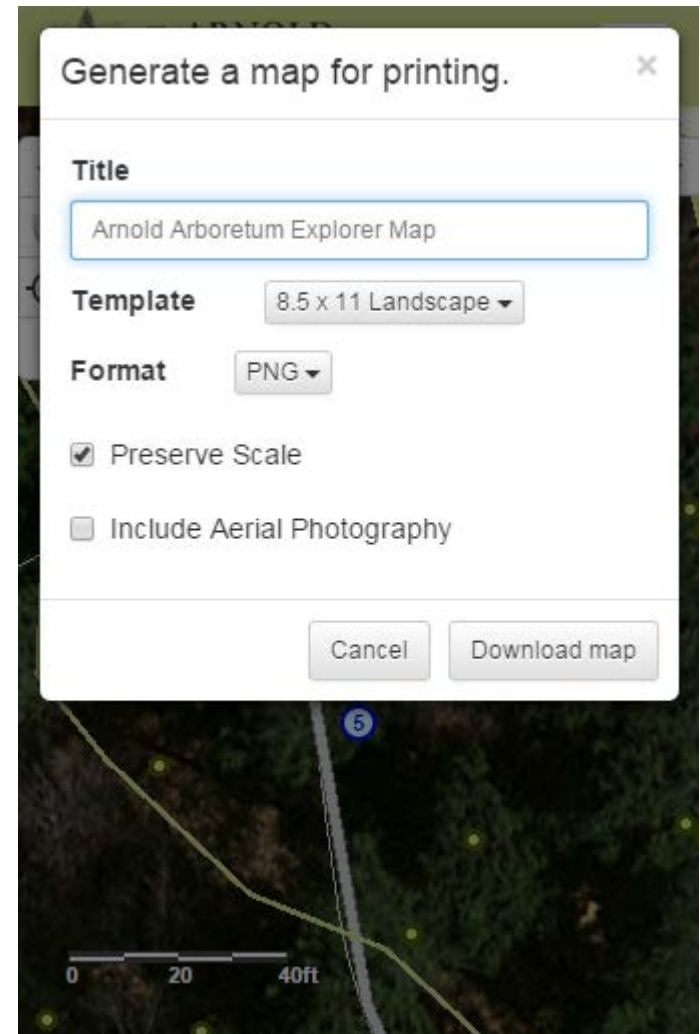

# Download Map

The Download Map function uses the ArcGIS Server Export Web Map geoprocessing function to create a file of the user's map.

Vector graphics that have been added to the map (e.g., Featured Tours, User Visits) are included in the exported map.

The Download Map Function allows users to select a template to print to, the file format of the export, and optional extent and display preferences.

The templates are provided via ArcMap documents from the server.

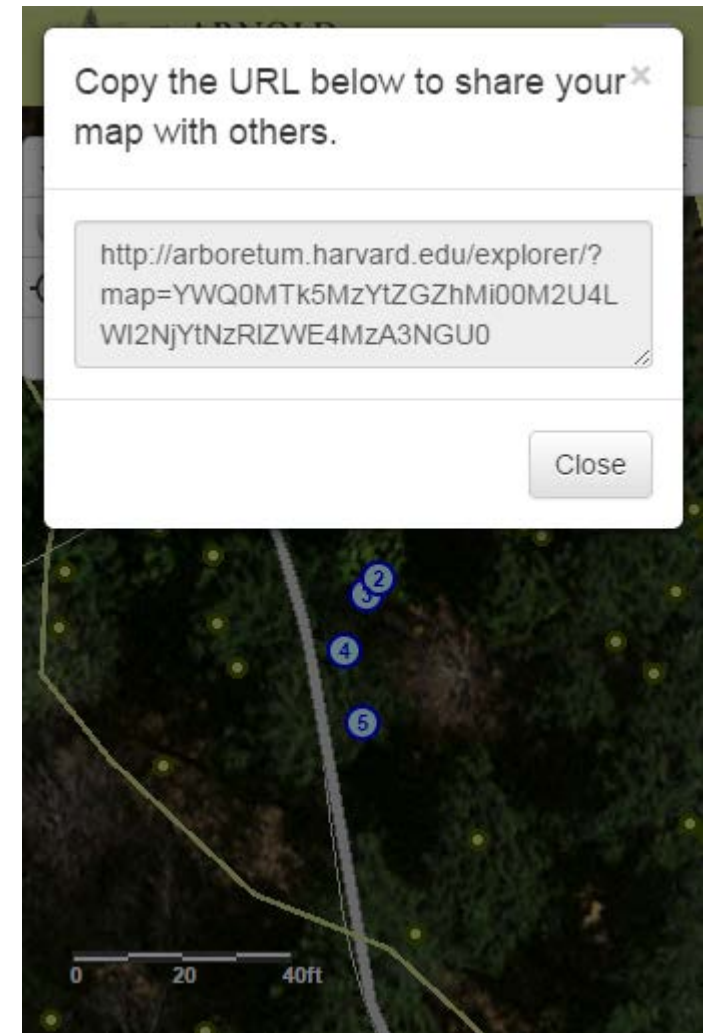

# Link Map

The Link Map function creates a representation of the user's current map, and makes the representation of the user's map available as a URL.

The representation of the map is stored and retrieved via ArcGIS Server Feature Services.

The representation of the map includes the map extent, the visibility of the layers (including the Featured Tours) and the plants that a user may have added to My Visit.

# Selecting Plants

Users can select plants either using a spatial selection or a text search.

The selected plants are highlighted on the map, and some of their attributes are displayed in a grid.

Users can add selected plants to their visit, as well as download a CSV formatted of the selected plants' attribute data.

Clicking on a row in the selection grid will open the Plant Detail.

The screenshot shows the website interface for The Arnold Arboretum of Harvard University. At the top, there is a logo, a "Donate" button, and a search bar. The main area is a map of Bussey Hill with 18 plants highlighted in blue and numbered 1-8. A scale bar at the bottom of the map indicates 0, 30, and 60 feet. Below the map is a table with 18 plants.

Plant ID	Name
1213-81*C	Syringa 'Pyramidalis Alba' x 'Excel'
1213-81*D	Syringa 'Pyramidalis Alba' x 'Excel'
1213-81*A	Syringa 'Pyramidalis Alba' x 'Excel'
1213-81*E	Syringa 'Pyramidalis Alba' x 'Excel'

# Plant Detail

The Plant Detail shows users additional attributes for the selected plant.

External resources (e.g., JSTOR, USDA, Google Images, etc.) are made available for the selected plant.

Users can generate an email message for the selected plant, and can also add the plant to their visit.

## Plant Detail

6621\*B

**Name**  
Aesculus glabra var. glabra

**Common Name**  
Ohio Buckeye

**Family**  
Sapindaceae

**Accession Date**  
11-15-1901

**Data Source**  
Krässmann, G. 1984. Manual of Cultivated Broad-leaved Trees & Shrubs. Vol. I. Portland, OR: Timber Press. 448 pp.

# Inventory Data

The Arnold Arboretum uses BG-BASE software to maintain its collection inventory

BG-BASE uses an OpenInsight database to store the inventory data

BG-BASE and the Arnold Arboretum worked together to create a SQL Server representation of the data so that the data could be imported into an ESRI Geodatabase

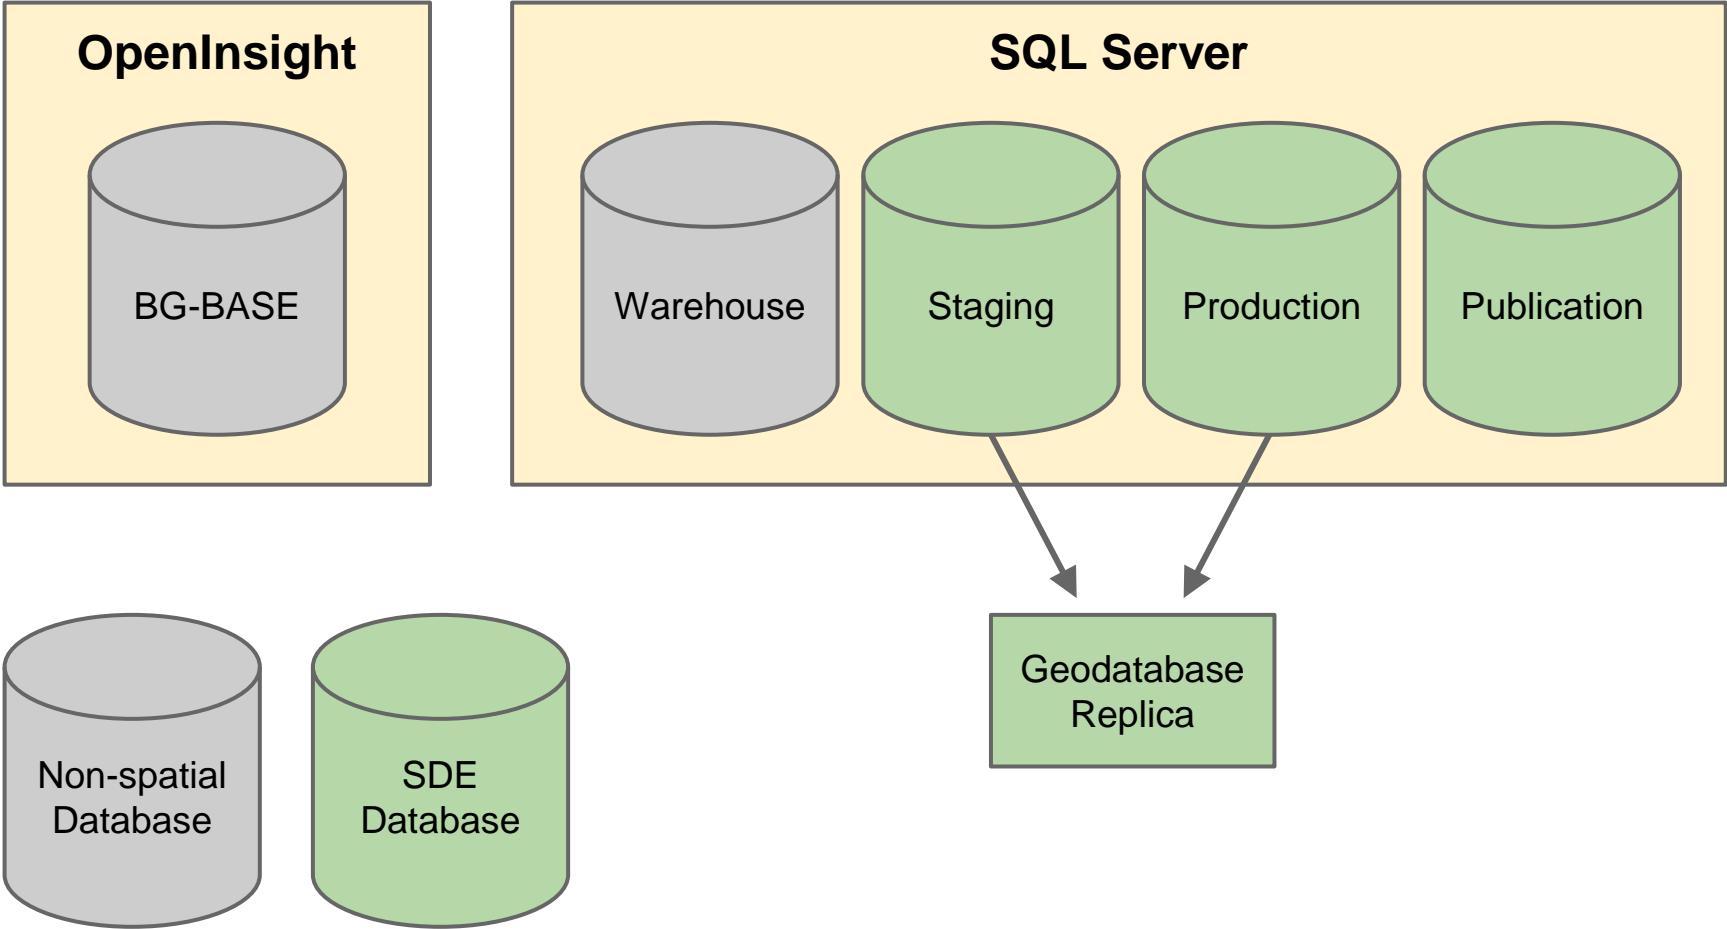

BG-BASE and the Arnold Arboretum also worked together to create a synchronization process to keep the inventory data and spatial data in sync. The software to achieve the synchronization is called the BG-BASE ArcGIS Connector.

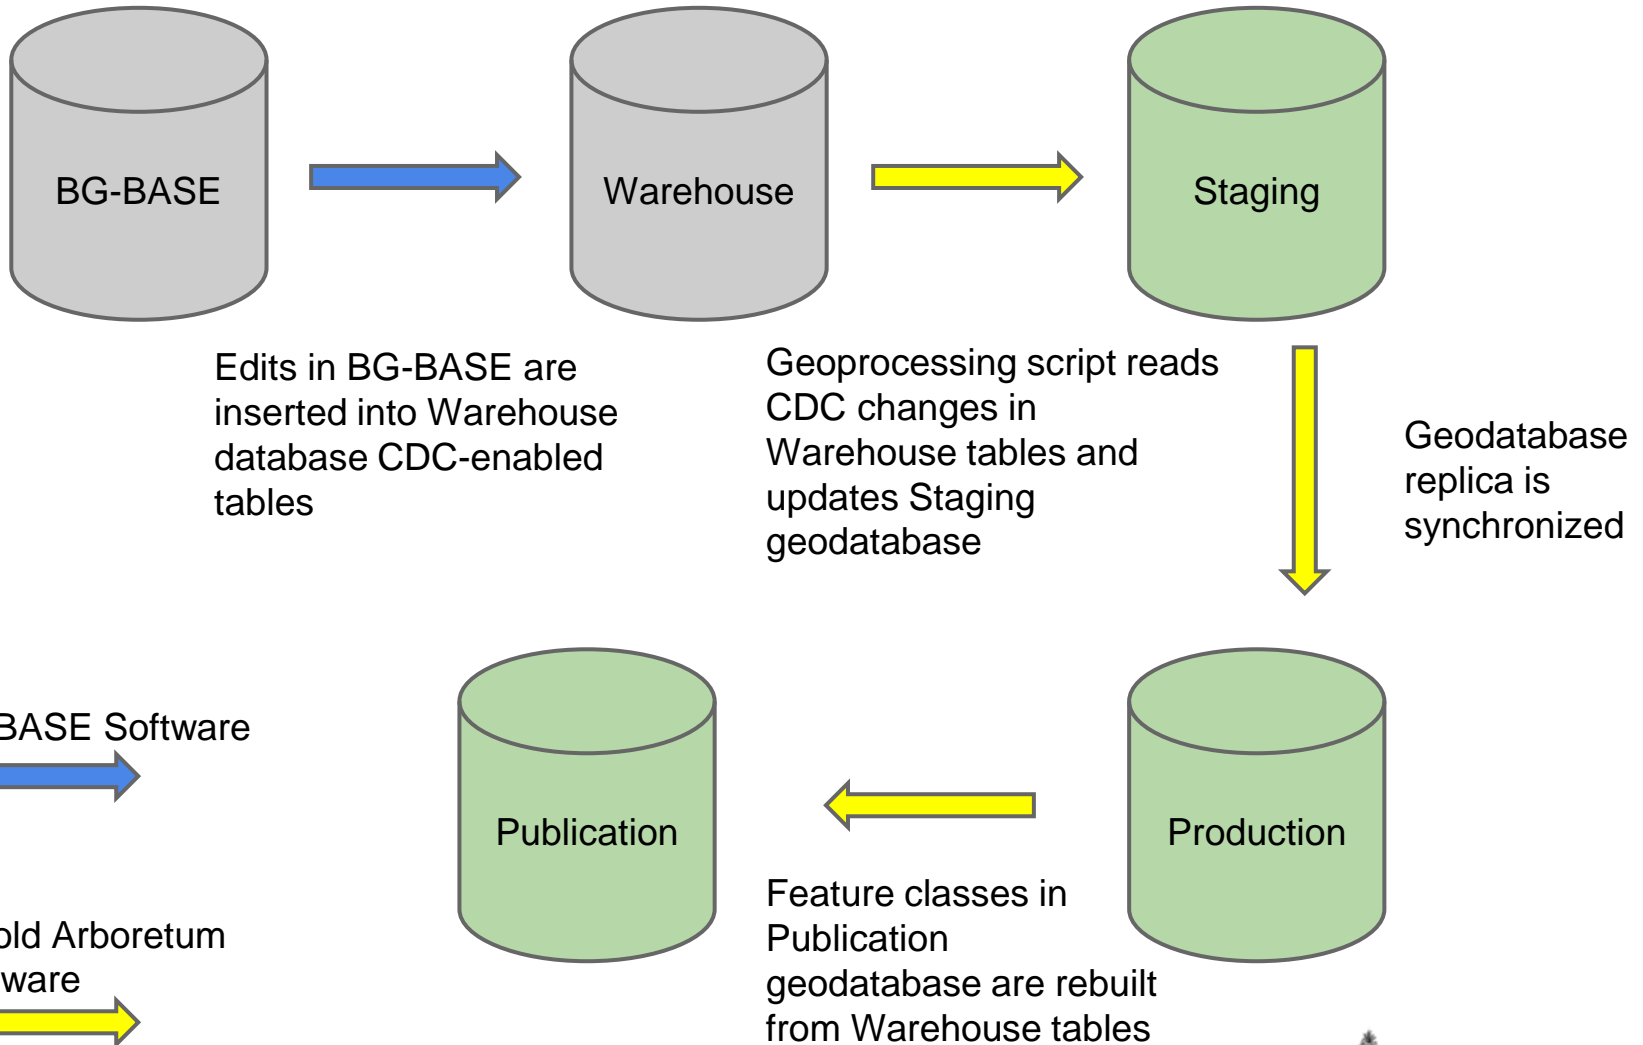

# Inventory Data

# ArcGIS Connector: BG-BASE to SDE

# ArcGIS Connector: SDE to BG-BASE

Edits made in Staging geodatabase are captured via ArcGIS Geodatabase Replica XML change file

XML change file sent to BG-BASE. BG-BASE reads changes from XML change file and updates BG-BASE database.

BG-BASE Software

Arnold Arboretum Software

# Acknowledgements

Thanks to:

Jason Sardano, GIS Software Engineer  
George Morris, Director of IT  
Stephen Hill, System Administrator  
Brian Morgan, Alliance for Public Gardens GIS  
Prof. Ned Friedman, Director of Arnold Arboretum

And thanks to all of the staff of the Arnold Arboretum, especially Visitor Education, Curation, and our Horticulturists.
