

Data Alignment and Management in ArcMap

Lisa Stanners, Sean Jones

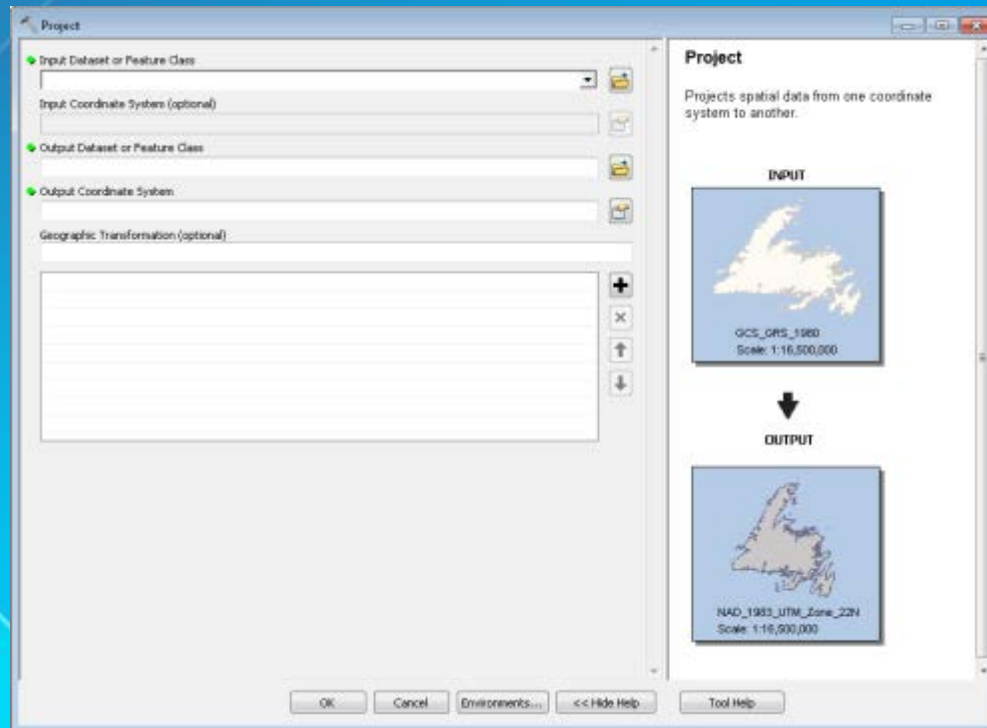

Agenda

- **Review tools available for improving spatial accuracy of your data**
 - **Spatial adjustment & Rubber sheeting**
 - **Snapping capabilities, tracing tools, auto-complete, etc.**
 - **Alignment tools**
- **Review tools available to maintaining accuracy & coincidence**
 - **Map Topologies & Geodatabase Topologies**

Spatial Adjustment

Projections

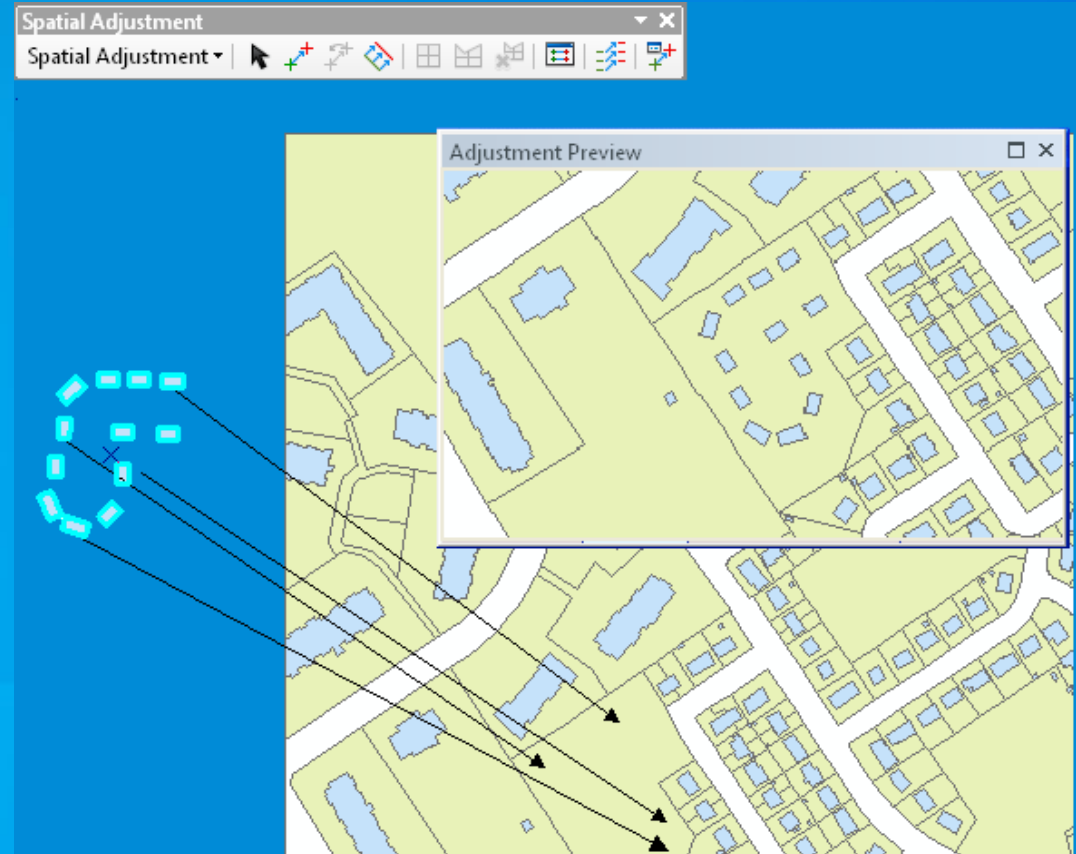

- Shift data between coordinate systems

Spatial Adjustment

Transformations

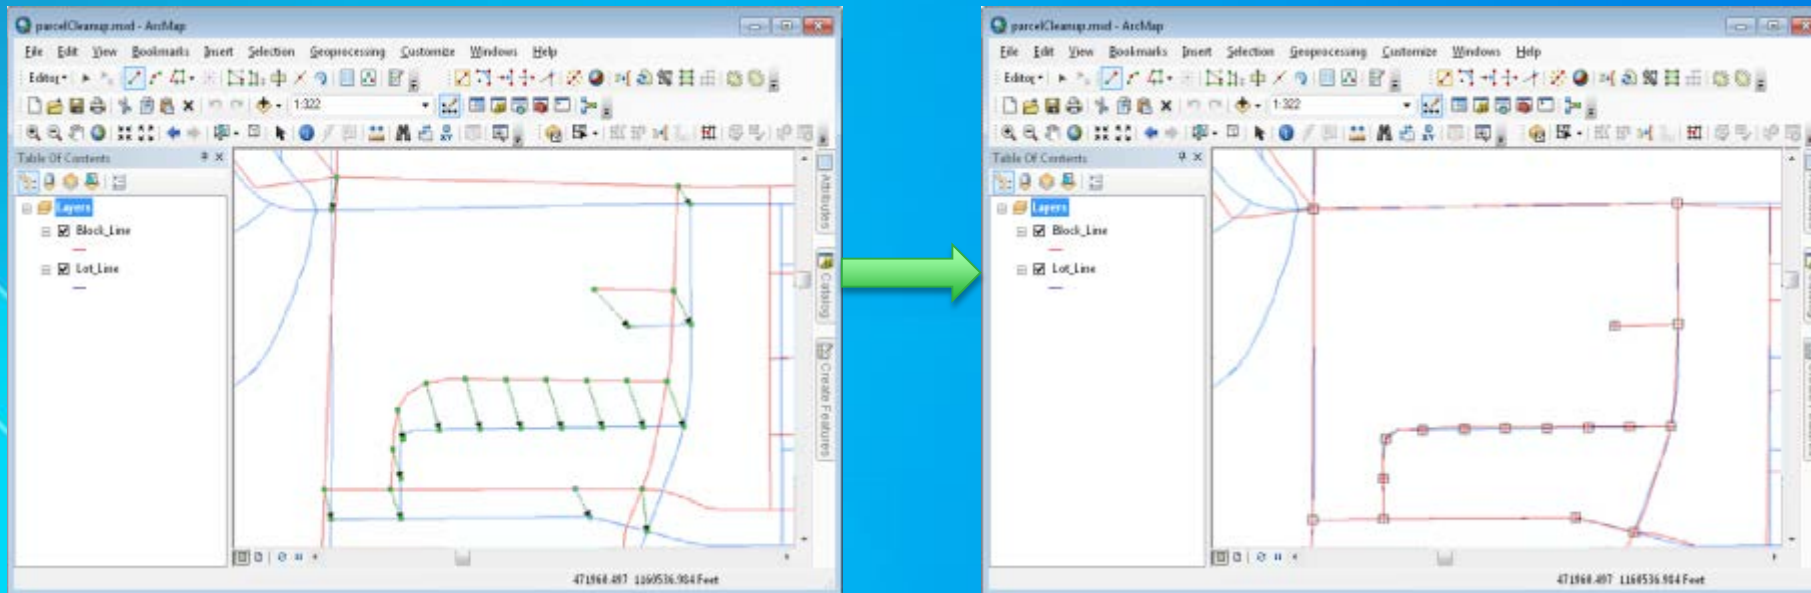

- **Shift data in coordinate space**
 - Digitize coordinates to real world
 - CAD coordinates to real world
 - Meters to Feet

Spatial Adjustment

Rubber Sheeting

- Aligns local data
- Integrating data from different scales and sources
 - Integrate 250K Hydro features into 50K data
 - Align national roads with local roads

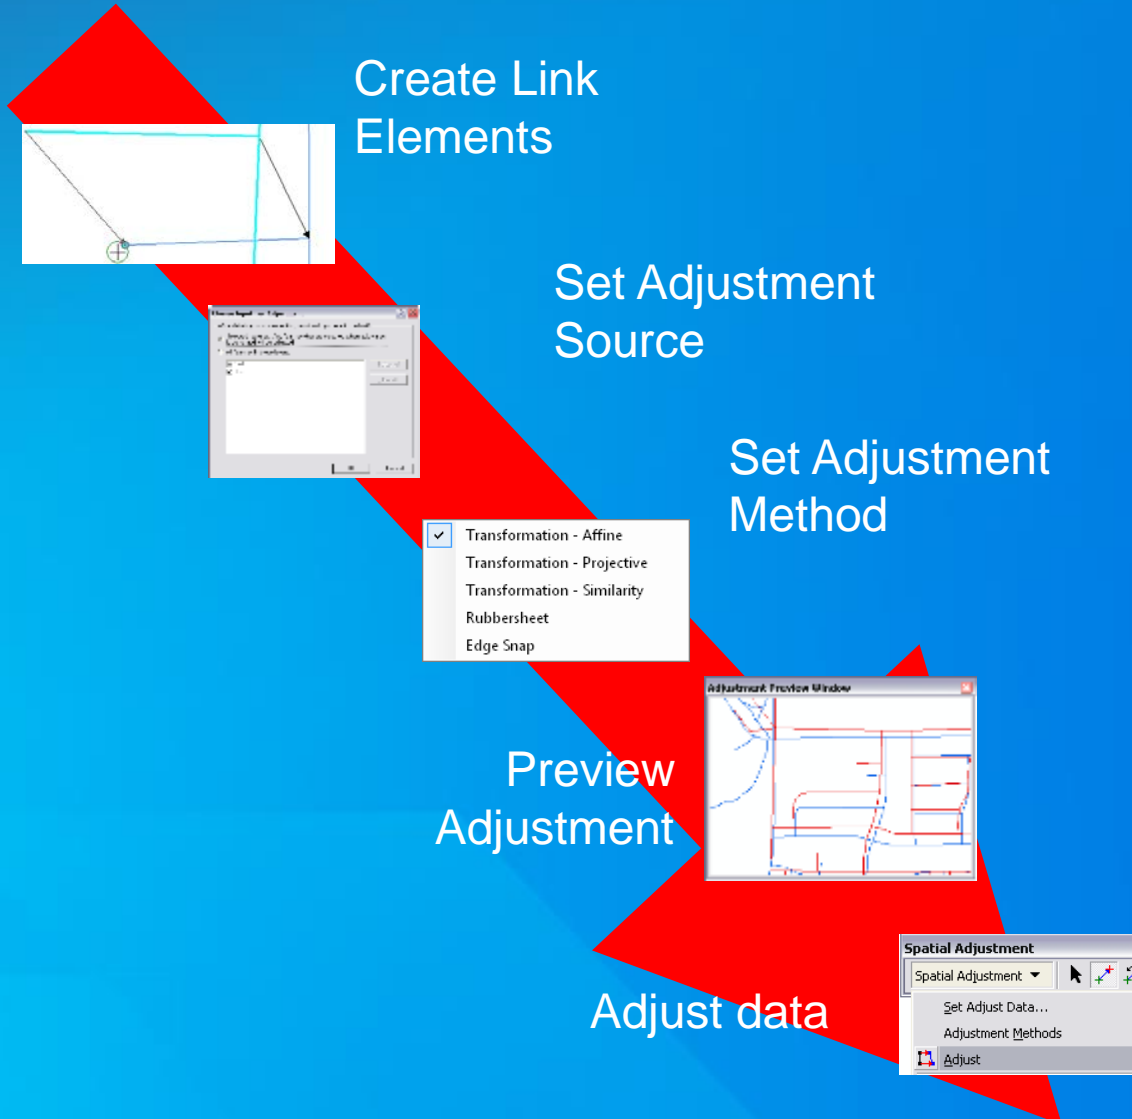

Spatial Adjustment Demo

Summary of Adjustment Process

- **Create Links**
- **Set Adjust source**
- **Set Adjustment Method**
- **Preview**
- **Adjust**

Keeping Your Data Aligned

- Know what the basic tools are and how to use them
 - Snapping environment
 - Basic snapping
 - “Classic” snapping
 - Snap to feature
 - Auto-Complete (polygon and freehand)
 - Trace construction tool
 - Extend and Trim tools
 - Auxiliary anchor (Rotate and Scale tools)

Keeping Your Data Aligned

- New tools introduced at 10.1 to help with this process:
 - Align To Shape – adjust layers to traced shape

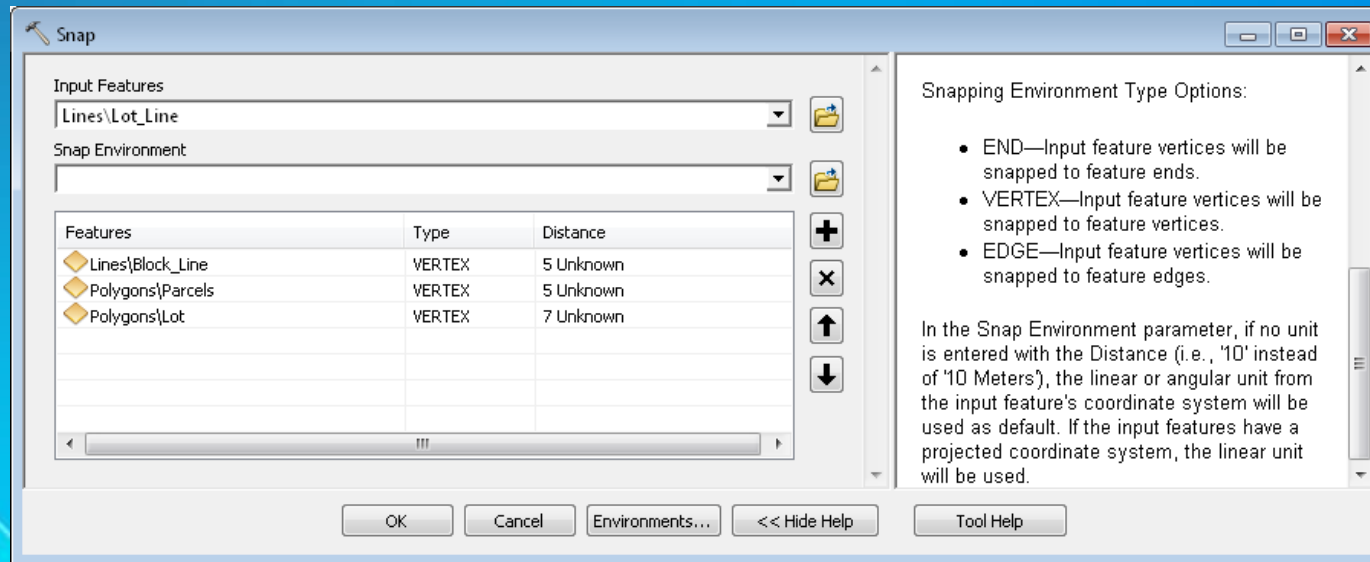

- Align Edge – snap edges together to close gaps

Geoprocessing Alignment Tools

- Snap – bulk snapping based on user specified rules
 - Edit session

- Integrate

Aligning Data Demo

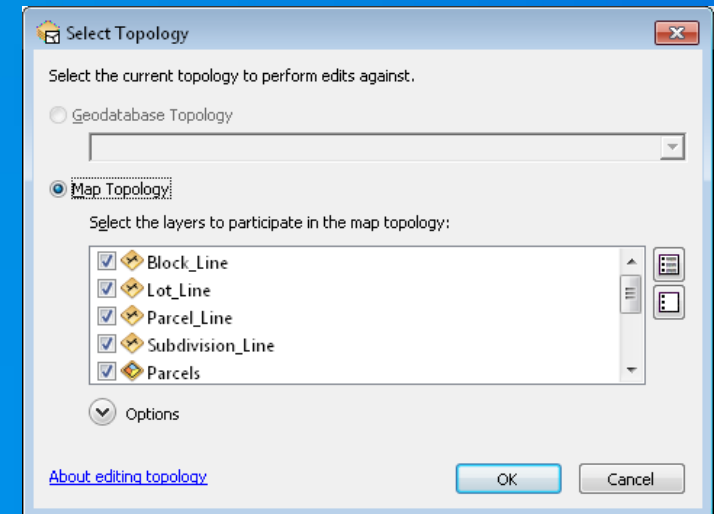

Topologies – Why would you want to use one?

1. Tools for editing coincident geometries between feature classes
2. Tools for finding and fixing errors based on rules you define

Topologies – What kinds are there?

1. **Map Topologies (requires only Basic license)**
 - Can be used with feature classes or shapefiles in same workspace
 - Saved in map document, not in the geodatabase
2. **Geodatabase Topologies (requires Standard license)**
 - Allows rules to be defined and errors found
 - Must be used with feature classes in same dataset
 - Persisted in the database, dirty areas created when features edited

Topologies – Editing coincident geometries

- Tools to select topology elements
 - Topology Edit Tool
 - Topology Edit Trace Tool
- Tools to update topology elements
 - Modify Edge
 - Reshape Edge
 - Align Edge
 - Generalize Edge
 - Reconnect Nodes

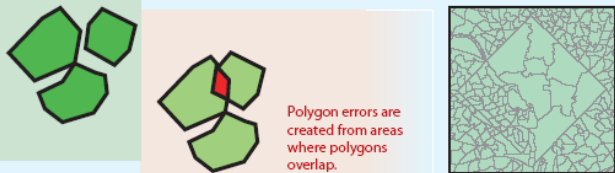

Topology Editing Tools Demo

Geodatabase Topologies – Topology Rules

- 32 topology rules
- Single or multiple feature classes
- Apply to feature class or subtype level
- Categorized by geometry type (polygon, line, point)
- Can also export topology errors with a Geoprocessing command
 - i.e Soil Polygons can't have gaps between them

Must not overlap

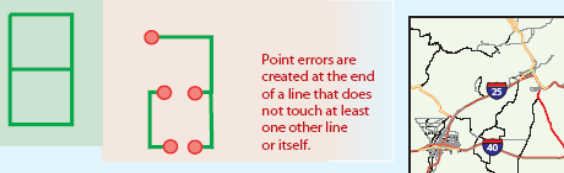

Polygons must not overlap within a feature class or subtype. Polygons can be disconnected or touch at a point or touch along an edge.

Polygon errors are created from areas where polygons overlap.

A voting district map cannot have any overlaps in its coverage.

Use this rule to make sure that no polygon overlaps another polygon in the same feature class or subtype.

Must not have dangles

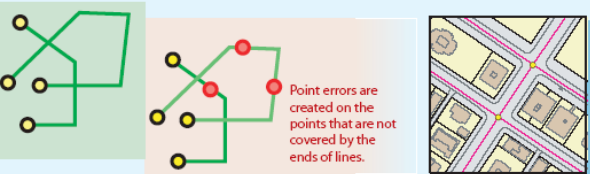

The end of a line must touch any part of one other line or any part of itself within a feature class or subtype.

Point errors are created at the end of a line that does not touch at least one other line or itself.

Use this rule when you want lines in a feature class or subtype to connect to one another.

A street network has line segments that connect. If segments end for dead-end roads or cul-de-sacs, you could choose to set as exceptions during an edit session.

Must be covered by endpoint of

Points in one feature class or subtype must be covered by the ends of lines in another feature class or subtype.

Point errors are created on the points that are not covered by the ends of lines.

Street intersections must be covered by the endpoints of street centerlines.

Use this rule when you want to model points that are coincident with the ends of lines.

Geodatabase Topologies – Validating a Topology

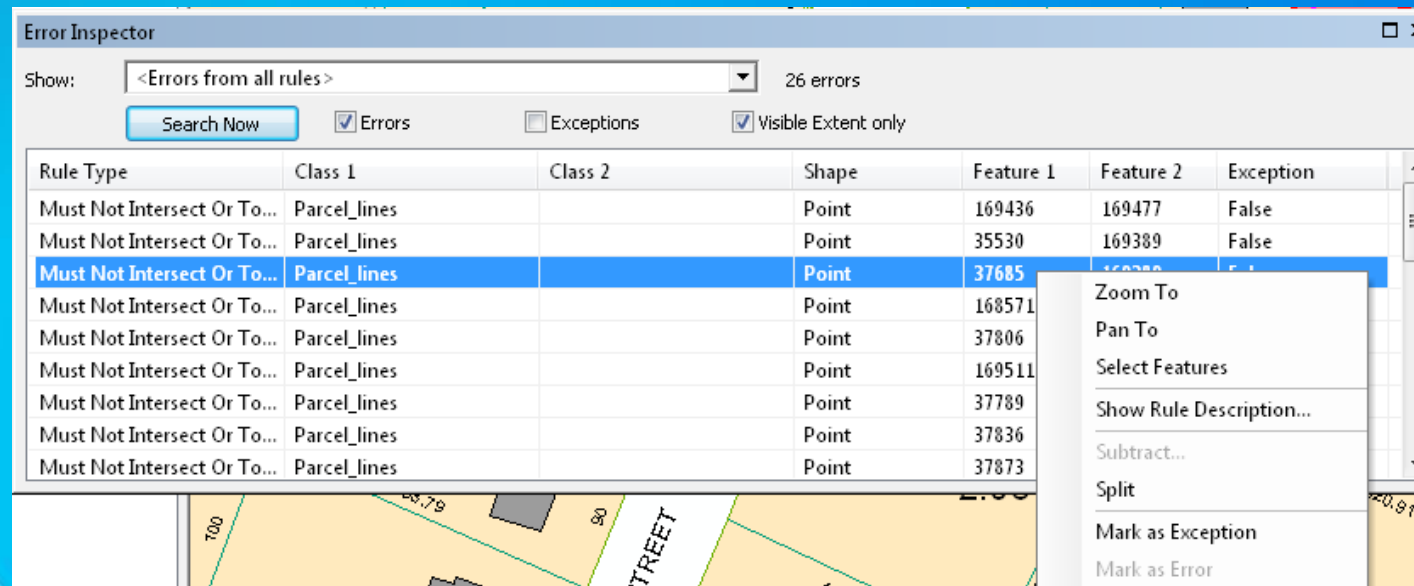

- Integrates geometries based on a cluster tolerance
 - **Cracking** – Vertices added at intersections of feature edges
 - **Clustering** – Snapping vertices that fall within cluster tolerance

- Validates topology rules which may generate errors
 - **Deletes errors if the rules are no longer violated**
- No new features are created

Geodatabase Topologies – Error Inspector

- Error Inspector lets you view and fix topology errors in a table.
 - The rule violated
 - The feature class or classes involved in the error
 - The geometry of the error
 - The feature ID of the features involved in the error
 - Whether or not the error has been marked as an exception

Geodatabase Topologies – Editing Errors

- **Errors cannot be deleted directly, the features must be edited and the topology re-validated**
- **Three options for correcting errors:**
 1. **Leave the error in the database**
 2. **Fix the error**
 3. **Elevate the error to exception status. This allows you to say this rule applies everywhere except ‘here’**

Geodatabase Topologies – Editing Errors

- Select the topology errors on the map
 - Creates an “Active Error Selection”
 - Context menu with fixes based on rule
- Revalidate after edits

Topology Errors Demo

Summary of Topologies

- **If you just need to edit coincident boundaries – consider a map topology**
- **If you need to define and validate rules – use a geodatabase topology**
- **With geodatabase topologies:**
 - **Build and validate to improve spatial integrity between your data layers**
 - **Use the available editor tools to find and fix your errors**
 - **Use automated fixes as much as you can, but they aren't the answer for every error**
