

# Using GIS to Assess and Route Neighborhood Greenways

Presented by **Diana Smith, GISP**  
Wednesday, June 29<sup>th</sup>, 2016  
ESRI User Conference, San Diego

# Diana Smith, GISP

- GIS Technical Manager at KTU+A
- Emphasis on GIS Analysis and Modeling in support of Active Transportation Planning & Community Planning
- Presentation covers work conducted as part of the Bicycle & Pedestrian Master Planning process in several cities around Southern California

## KTU+A

- Team of 37 Landscape Architects, Planners, GIS Analysts, Graphic Designers & Irrigation Designers

# Why Active Transportation?

- Environmental Benefits
- Health Benefits
- Economic Benefits

**0.95 lbs**

**0.07 lbs**

Vehicles produce approximately 0.59 lbs of CO<sub>2</sub>/passenger/mi traveled of carbon emissions. Bicycling only produces 0.05 lbs of CO<sub>2</sub>/passenger/mi traveled (EPA, 2014).

3 hours of biking per week can reduce your risk of heart disease by 50% (CDC, 2015).

Calories you can burn during a 30-min bike ride (CDC, 2015).

13 lbs average weight loss in first year biking to work (CDC, 2015).

# The Impact of Bicycle Facilities

- According to the Pedestrian-Bicycle Information Center, 2014.

Seattle  
2007-2010

Salt Lake City  
2010-2011

New York City  
2010-2011

Philadelphia  
2009

Cambridge  
2002-2006

Minneapolis  
2010

# What Makes a NG?

“Neighborhood Greenways are residential streets with low volumes of auto traffic and low speeds where bicycles and pedestrians are given priority.”

## -City of Portland, PBOT

- Improve safety
- Help people cross busy streets
- Discourage cars from using neighborhood streets to avoid main streets
- Protect the residential character of our neighborhoods
- Keep speeds low
- Get people to where they want to go like parks, schools, shops and restaurants

## -City of Seattle, DOT

### Bicycle Toolbox : Shared-Street Facilities

#### What Do We Want ?

Bicycle Boulevard

#### How Do We Get There?

Road with Narrow Pavement Markings

Enhanced Crosswalks & Neighborhood Connections

Attractive and Unique Bike Boulevard Signage

# Identifying Potential NGs Using GIS

## Key Attributes

- Length
- Speed
- Functional Class
- Major Crossings

## Bonus Attributes

- ADT (1500-2000)
- Number of Lanes
- Slope
- Tree Canopy/Shade
- Collisions
- Scenic Quality
- Unpleasant Visual/  
Olfactory Land Uses

# Typical Routing Analysis

**Input Road Network**

**Isolate Suitable Road Segments**

**Derive NG Routes**

**> Hand off to Active Transportation Planner for Analysis and Selection of Recommended Routes**

# Enhanced Routing Analysis

## Weighted Attractor Density

- Attractors
- Community Feature
  - Elementary School
  - Future Opportunity
  - High School
  - Library
  - Middle School
  - Park
  - Shopping Center
  - Transit Station

- Attractor Density
- High Density
  - Low Density

- # Key Network Stops

# Attributes & Sources

## Typical Attributes:

- Length (Shape)
- Speed (OpenStreetMap)
- Functional Class (OpenStreetMap)
- Major Crossings (Geoprocessing)

## Augmented Network With:

**Collisions**  
(TIMS  
Berkeley)

Spatial Join between  
Collisions and Road  
Segments >  
Classified Segments  
in three Tiers >  
Incorporated using  
Hierarchy Attribute

**Number  
of Lanes**  
(OSM)

Extracted Lane  
Data from  
OpenStreetMap  
and  
incorporated  
into Network.

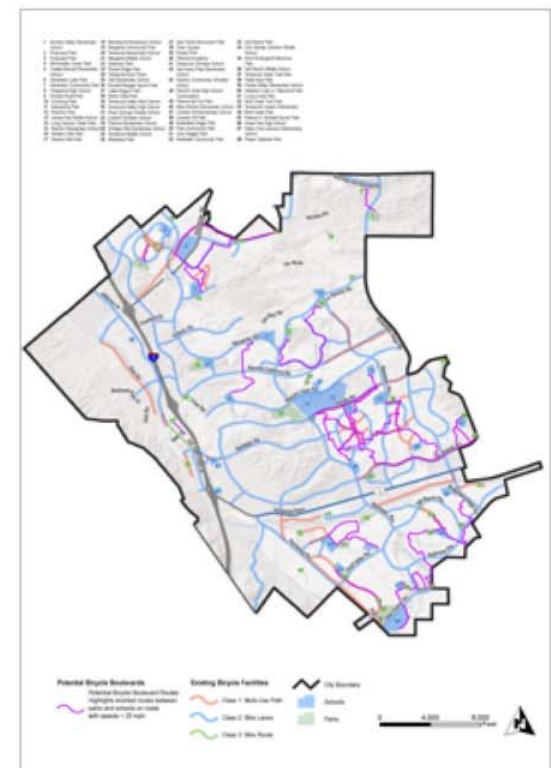

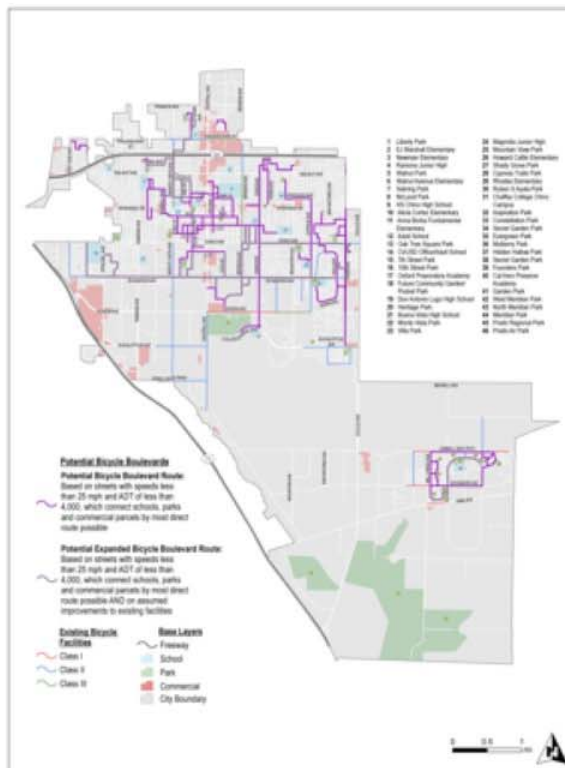

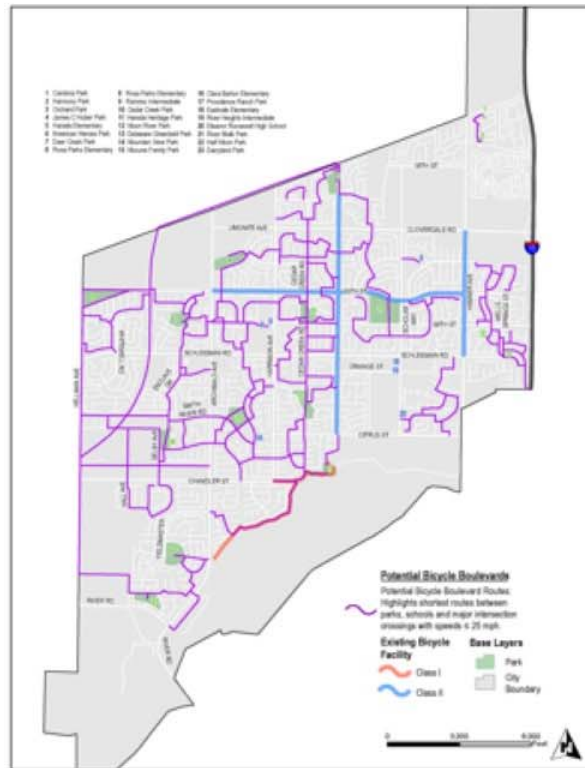

**Turns**  
(Generated  
Global Turns)

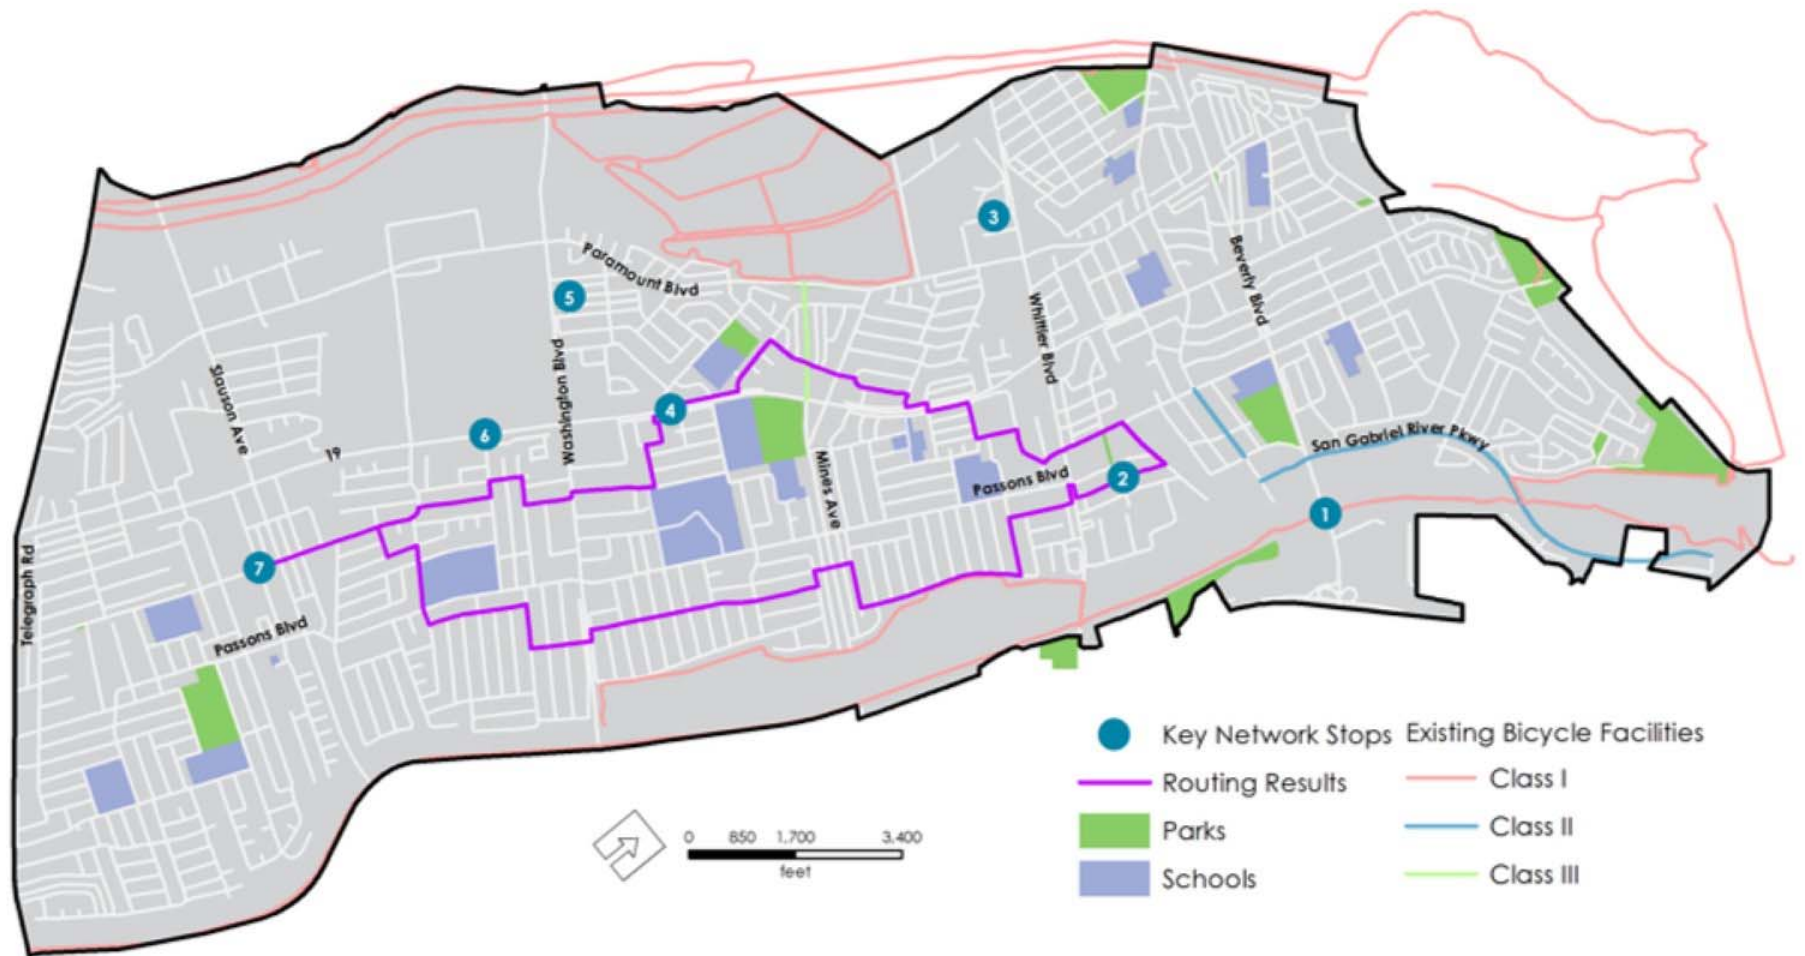

Modeled Global  
Turns and Heavily  
Weighted both Right  
and Left turns  
adding significant  
cost to the  
alternative.

# Previous Results

# Enhanced Results!

# Conclusions

- Previous results presented Transportation Planners with too many options causing 'planning fatigue'
- NG Routes should augment Bicycle Plans – not dominate – these highly refined routes are the ideal compliment to proposed Class I-III
- Heavily weighted global turns replaced need for calculation of out of direction travel
- Future iterations to include Tree Canopy/Shade, Land Use Adjacency, and more!

# Questions???
