Agenda

- 1 Performing Analysis in Real Time
 - 2 Use Case 1: Identifying Conditions
 - 3 Use Case 2: Finding Patterns in Data
 - 4 Use Case 3: Workforce Tracking
 - 5 Summary & Resources
-

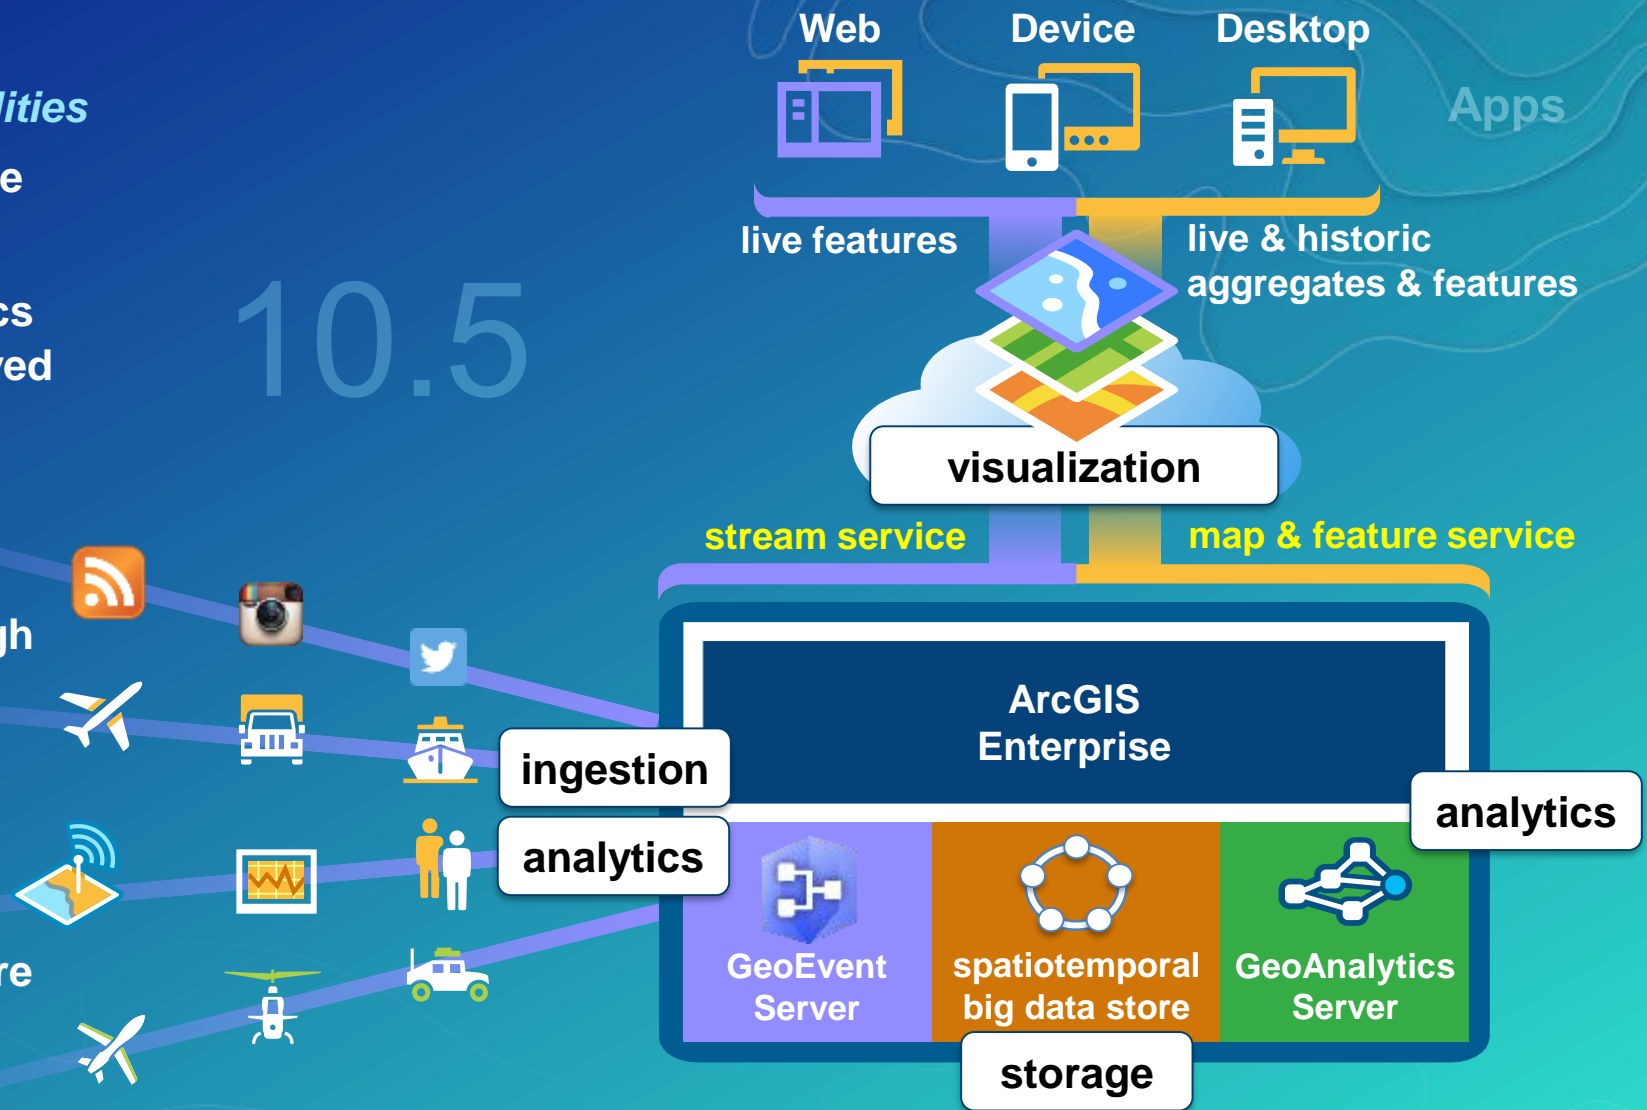

Performing Analysis in Real Time

ArcGIS Enterprise

with real-time & big data capabilities

- Ingest high velocity real-time data into ArcGIS
- Perform continuous analytics on events as they are received
- Notify those who need to know about patterns of interest
- Visualize high velocity & high volume data:
 - as an aggregation
 - as discrete features
- Store observations in a spatiotemporal big data store
- Run batch analytics on stored observations

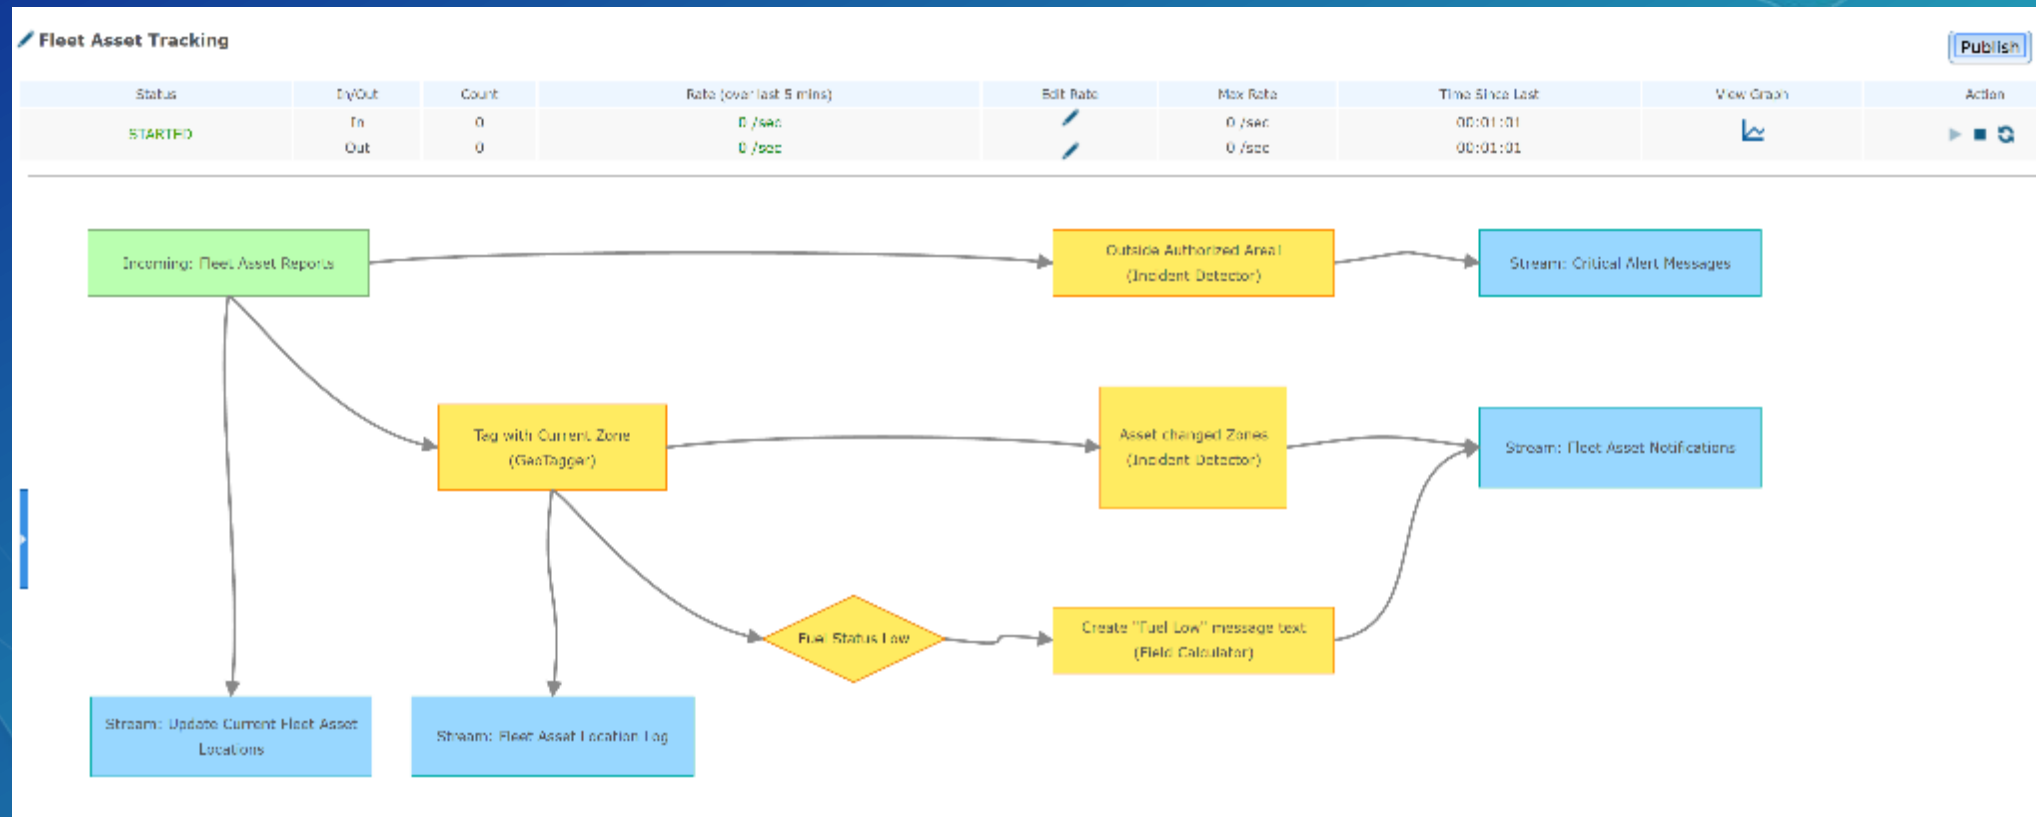

10.5

Applying real-time analytics

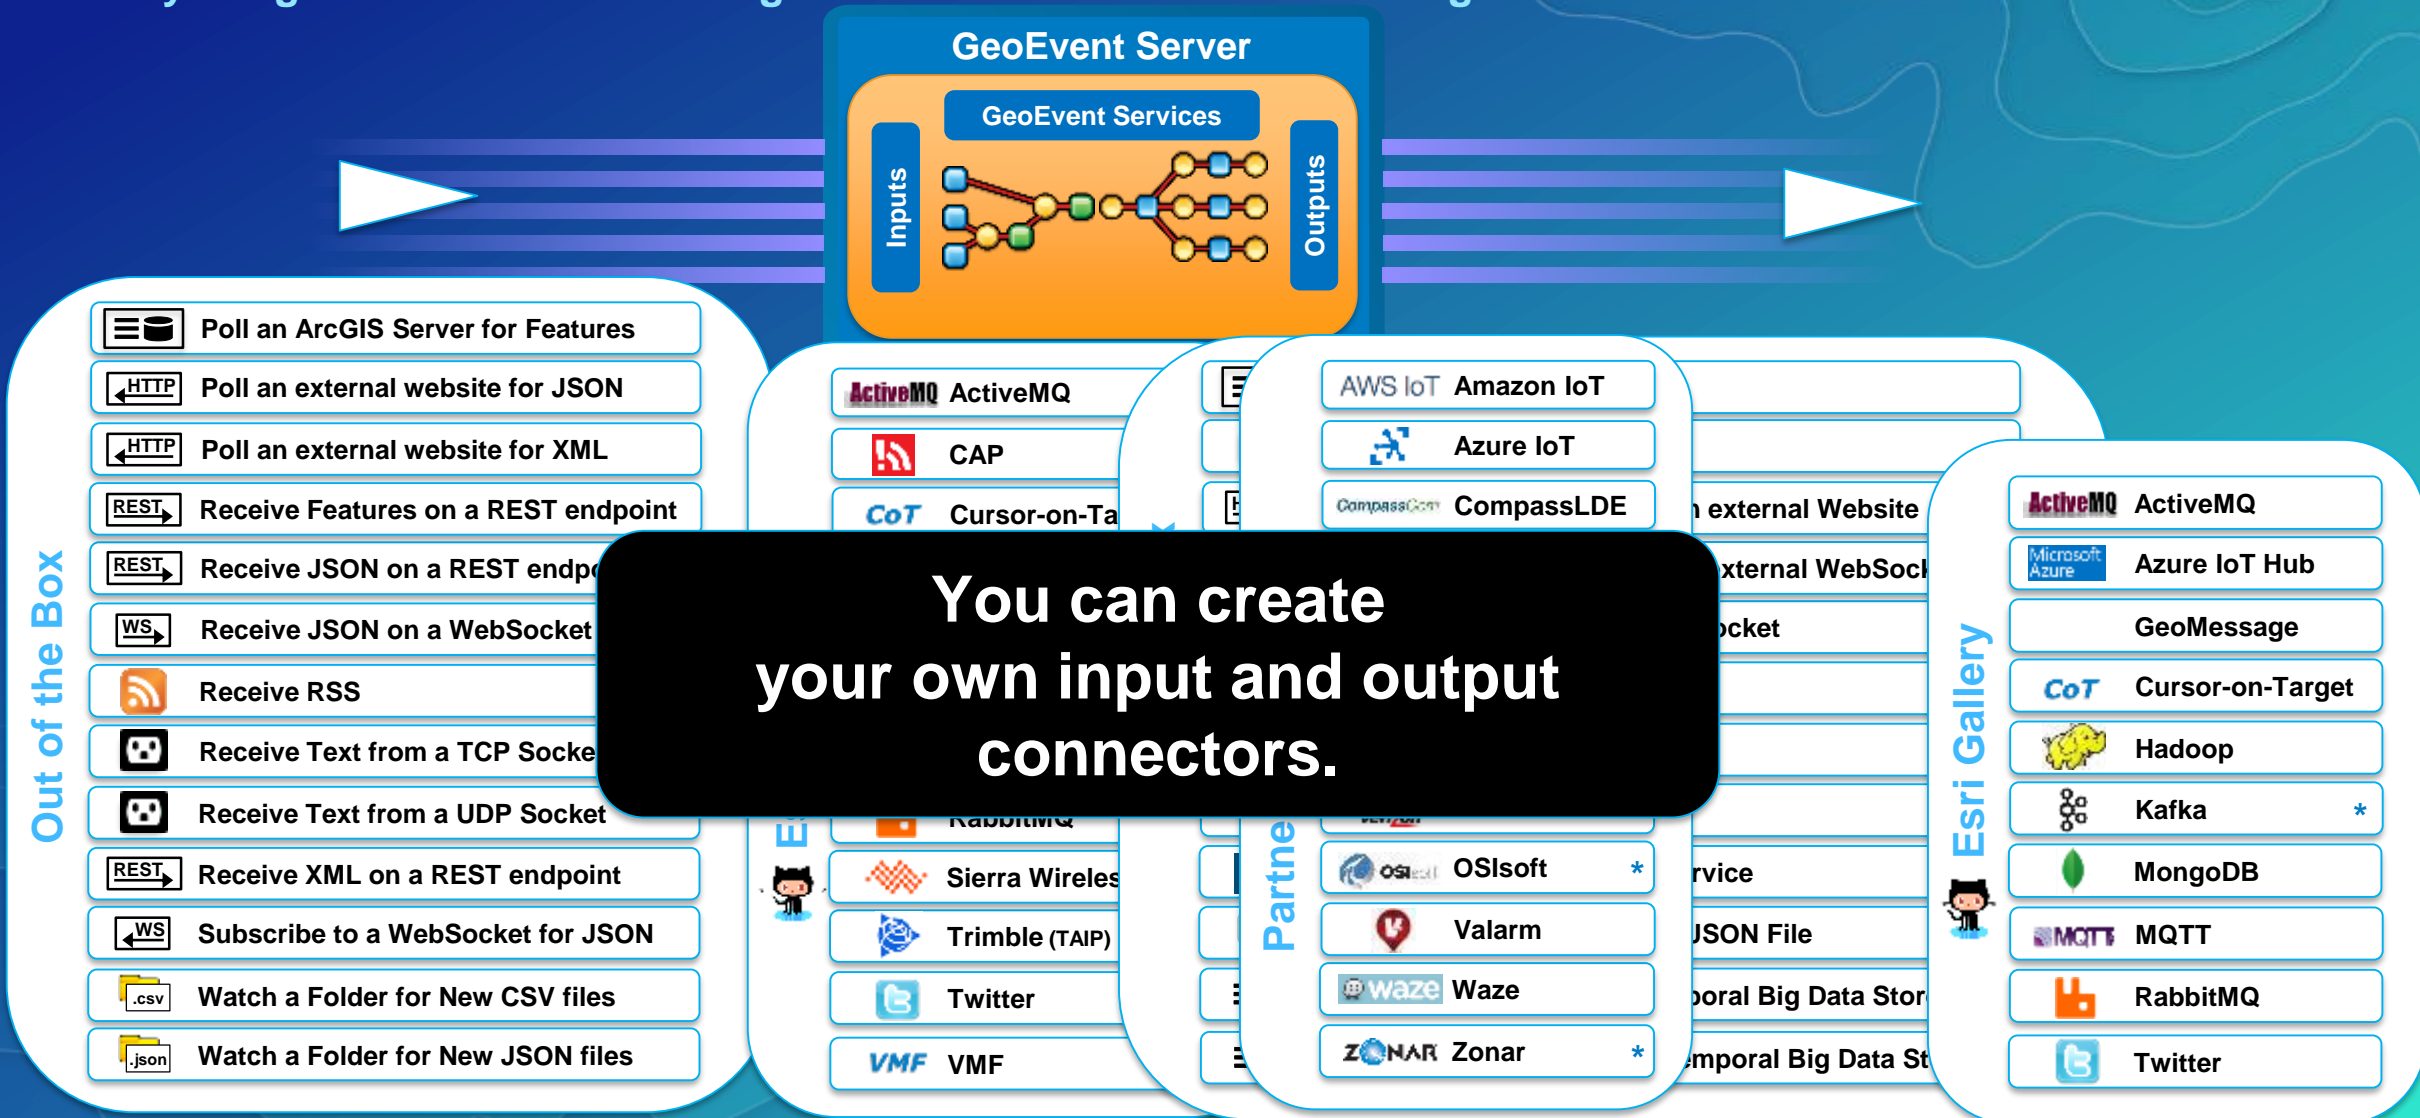

Perform real-time analytics by defining a GeoEvent Service

- A **GeoEvent Service** configures the flow of GeoEvents
 - The **Filtering** and **GeoEvent Processing** steps performed
 - The input(s) data comes from and the output(s) to which results are sent

Receiving and Sending Real-Time Data

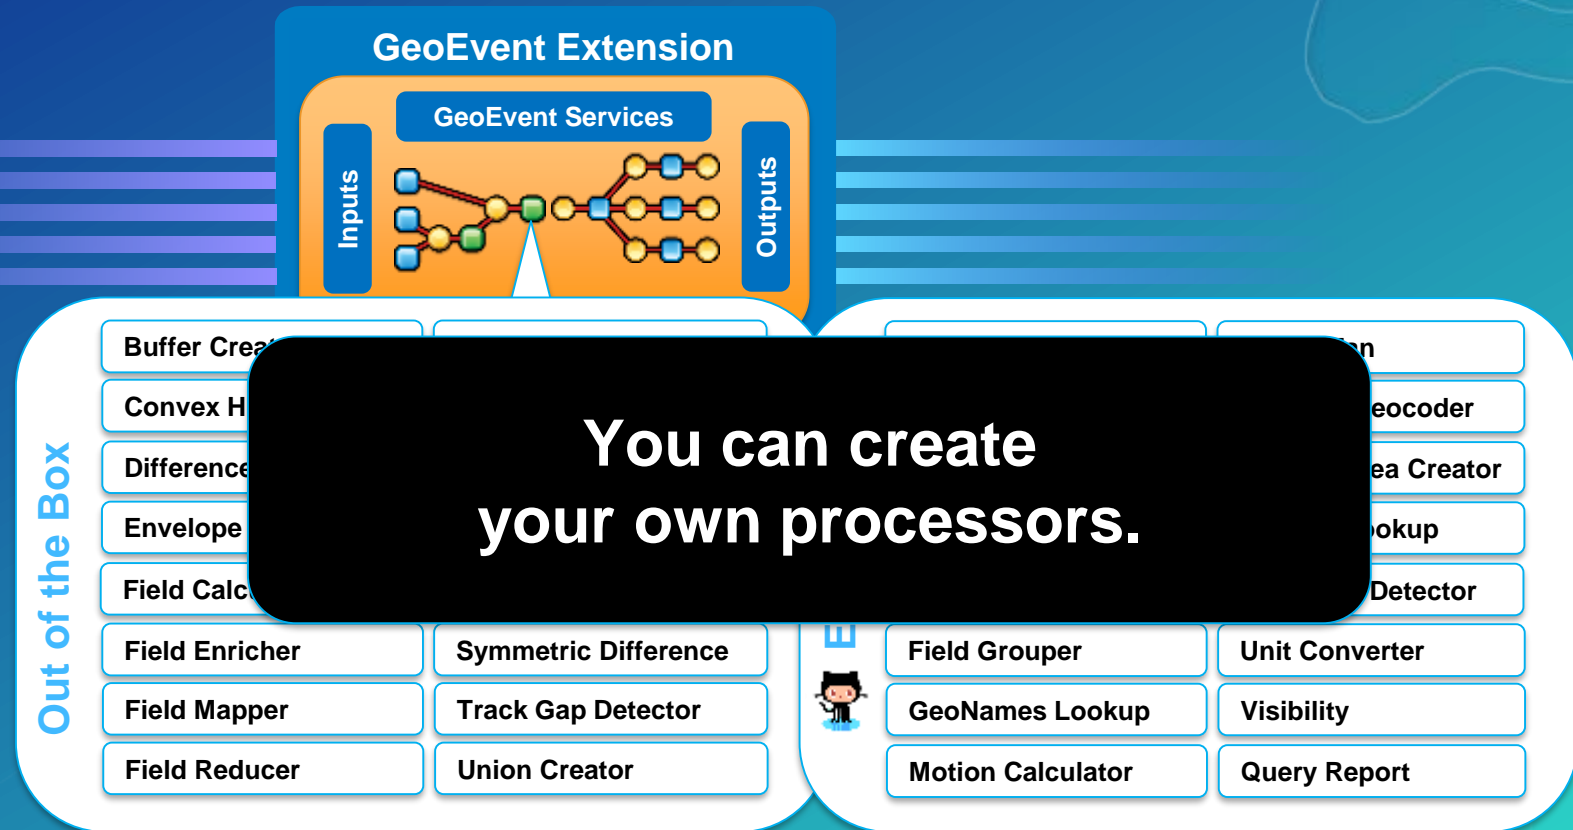

Easily integrate real-time streaming data into and out of ArcGIS using Connectors

Applying real-time analytics

GeoEvent Processing

- Perform continuous analytics on GeoEvents as they are received using **processors and filters**.

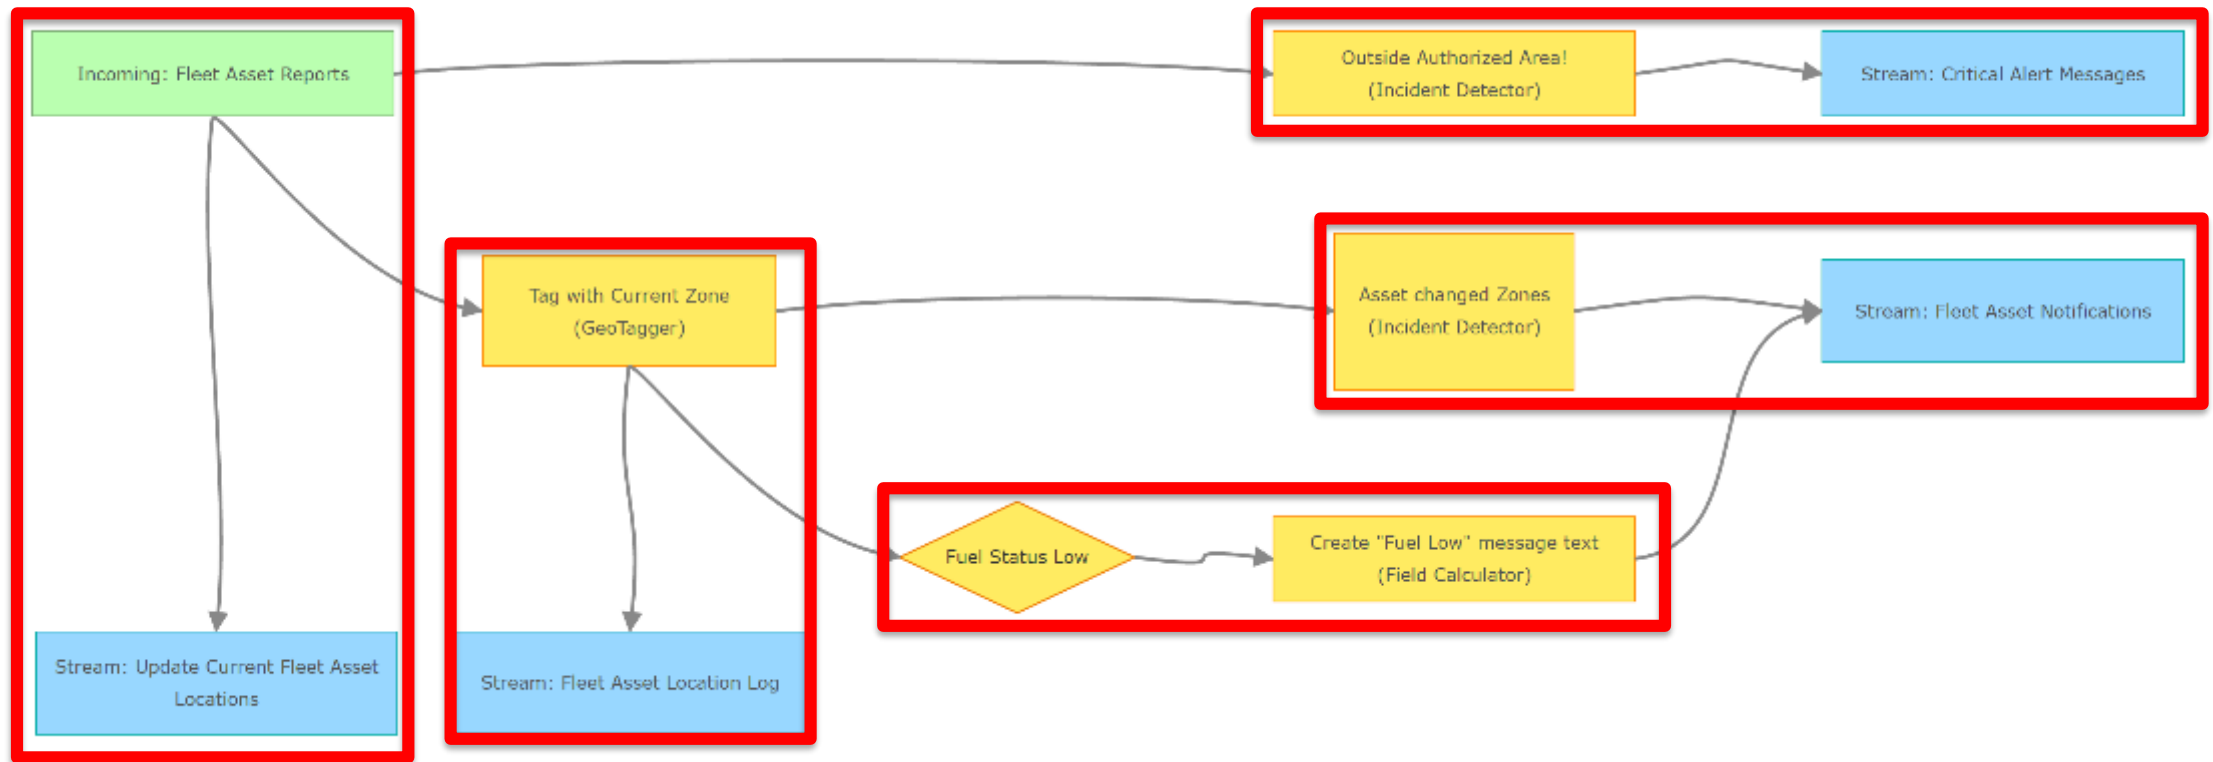

Alert(s)

Notification(s)

Fleet Asset Tracking Pseudo Service

The analytics behind the construction site example

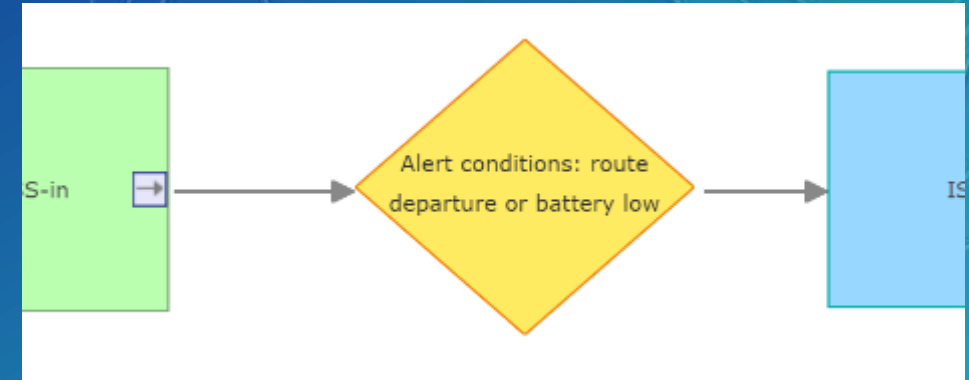

Processors

- Some work only on geometry
- Some work on geometry and/or attributes
- Some respond to spatial and/or attribute conditions and generate new messages
- Processors typically transform the GeoEvent in some way

Filters

- Only allow messages to pass that evaluate to true
- Can filter by spatial and/or attribute conditions
- Spatial filters operate on event geometry and GeoFences

A screenshot of a filter configuration interface. It shows a dropdown menu on the left, a text input field containing 'BatteryLevel >= 5', and a green plus icon with a blue plus sign and parentheses '+()' below it.

A screenshot of a filter configuration interface. The 'Name' field is set to 'Alert conditions'. A red box highlights the filter rules section, which contains two conditions: 'GEOMETRY DISJOINT ANY DeliveryRoutes/.*' and 'BatteryLevel <= 5'. An 'OR' dropdown is visible between the two conditions. A green plus icon with a blue plus sign and parentheses '+()' is at the bottom.

A screenshot of a filter configuration interface. A red box highlights the 'Geofence' and 'DeliveryZones' section. The 'Field' dropdown is set to 'GEOMETRY', and the 'Operator' dropdown is set to 'INTERSECTS'. The 'Geofence' dropdown is set to 'ANY', and the 'DeliveryZones' dropdown is set to 'DeliveryZones'.

Use Boolean logic (AND, OR, NOT) to combine or negate expressions

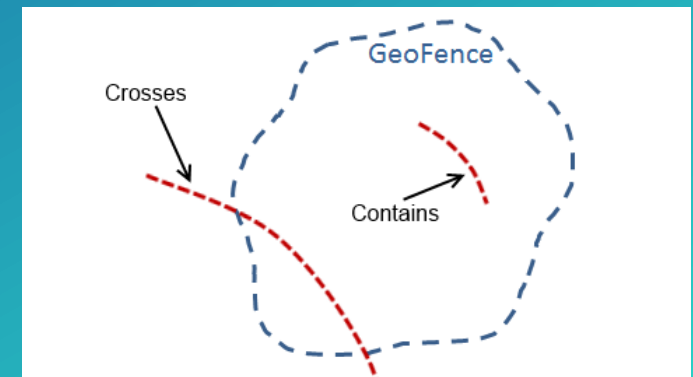

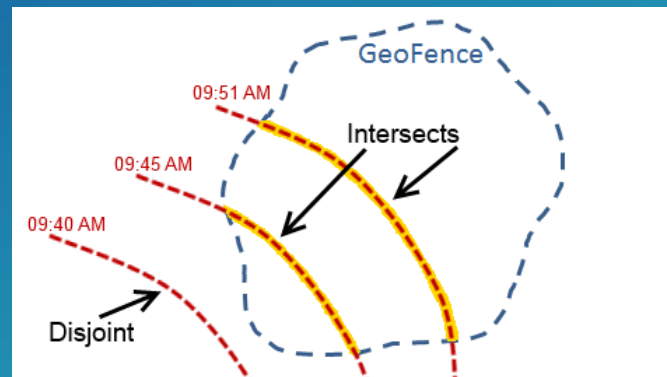

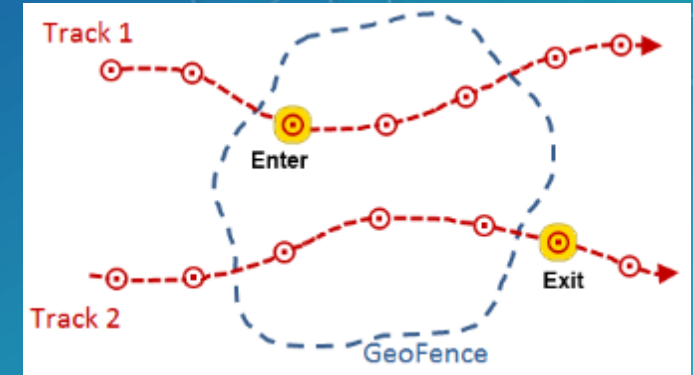

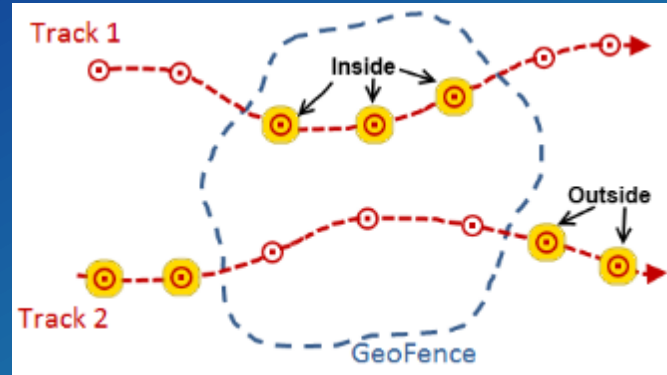

Spatial Operators

- Spatial operators at 10.2:

inside	outside
enter	exit

- Spatial operators at 10.3 and beyond:

intersect	disjoint
touches	contains
crosses	equals
overlaps	within

Spatial Operators

GeoFence selection vs. spatial operator scope

- Don't confuse “ANY” and “ALL” with the regular expression pattern used to select a set of geofences

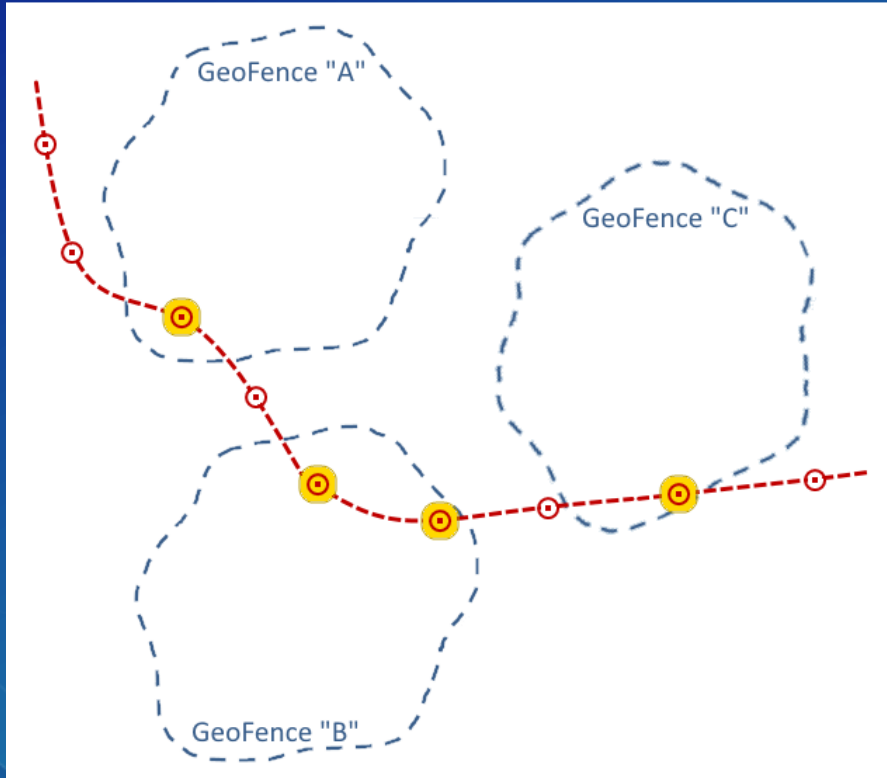

GEOMETRY INTERSECTS ALL .*/.*

GEOMETRY DISJOINT ANY .*/.*

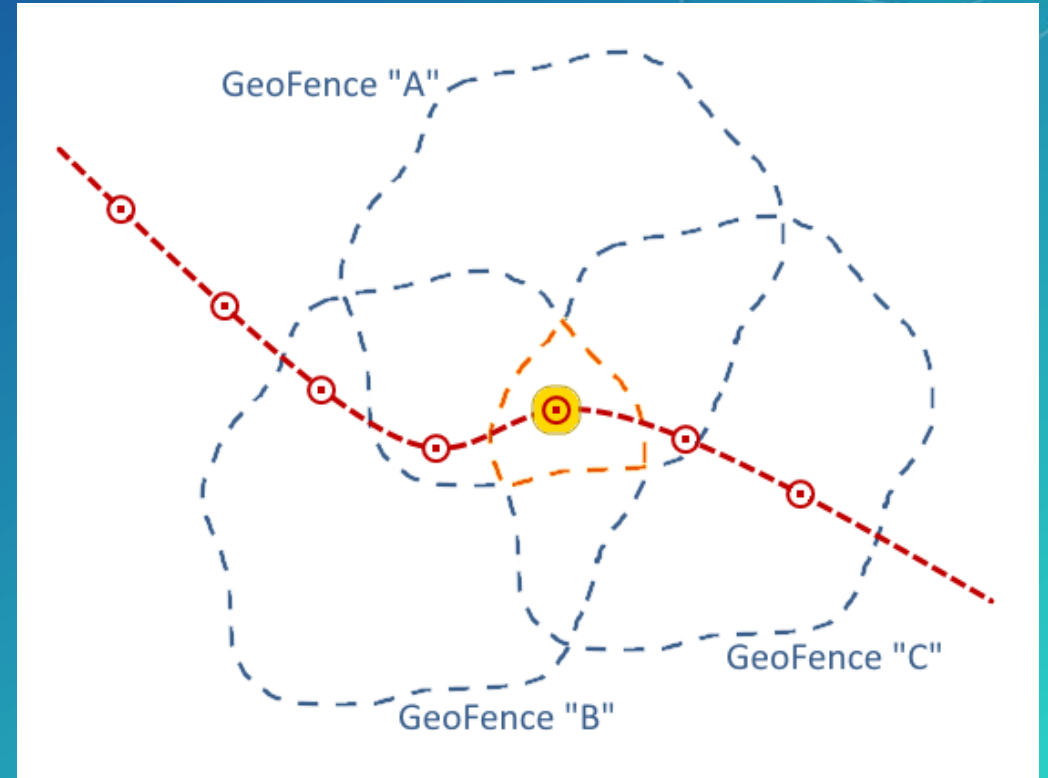

Spatial Operators

Example: Overlapping GeoFences

- Intersects Any geofence

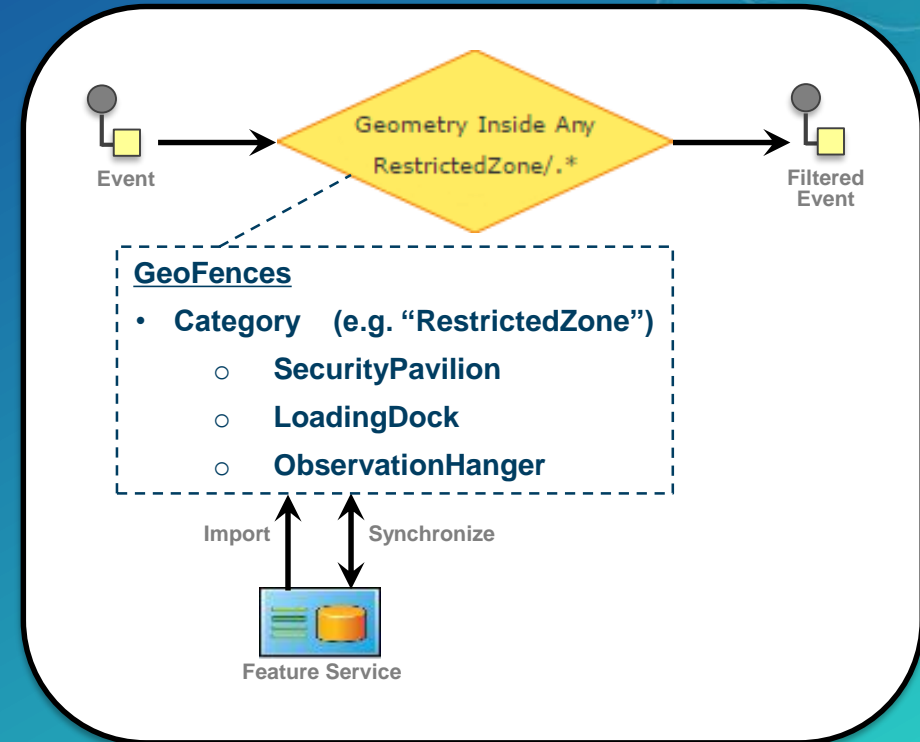

- Intersects All geofences

GeoFences

Load or synchronize GeoEvent Server with a feature service

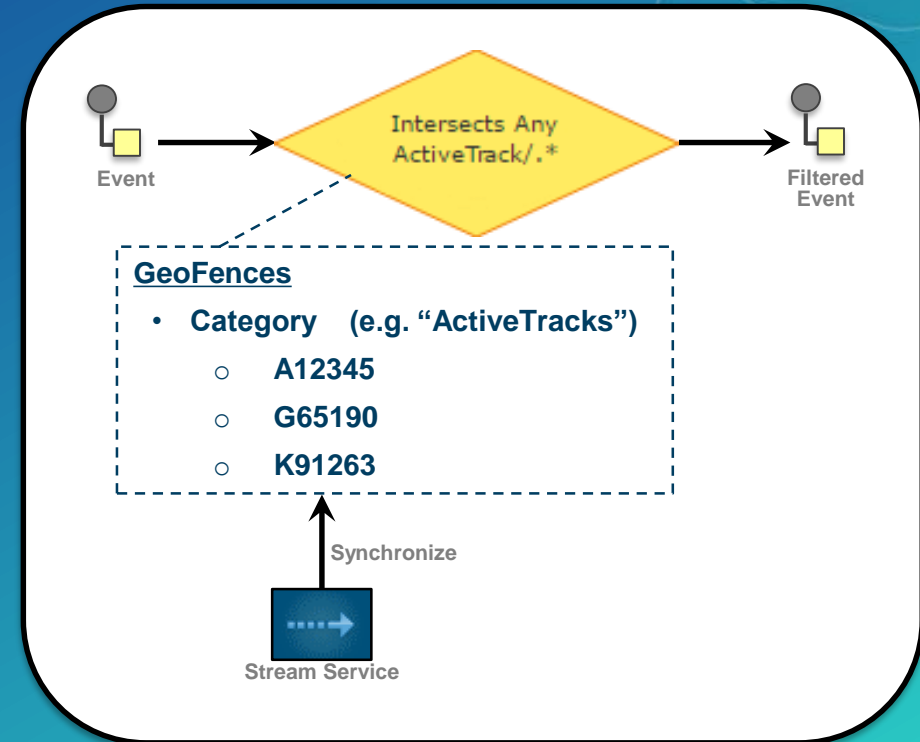

- Import from a feature service
 - Reads once (good for static geofences)
- Synchronize with a feature service
 - Periodically refreshes to update geofences

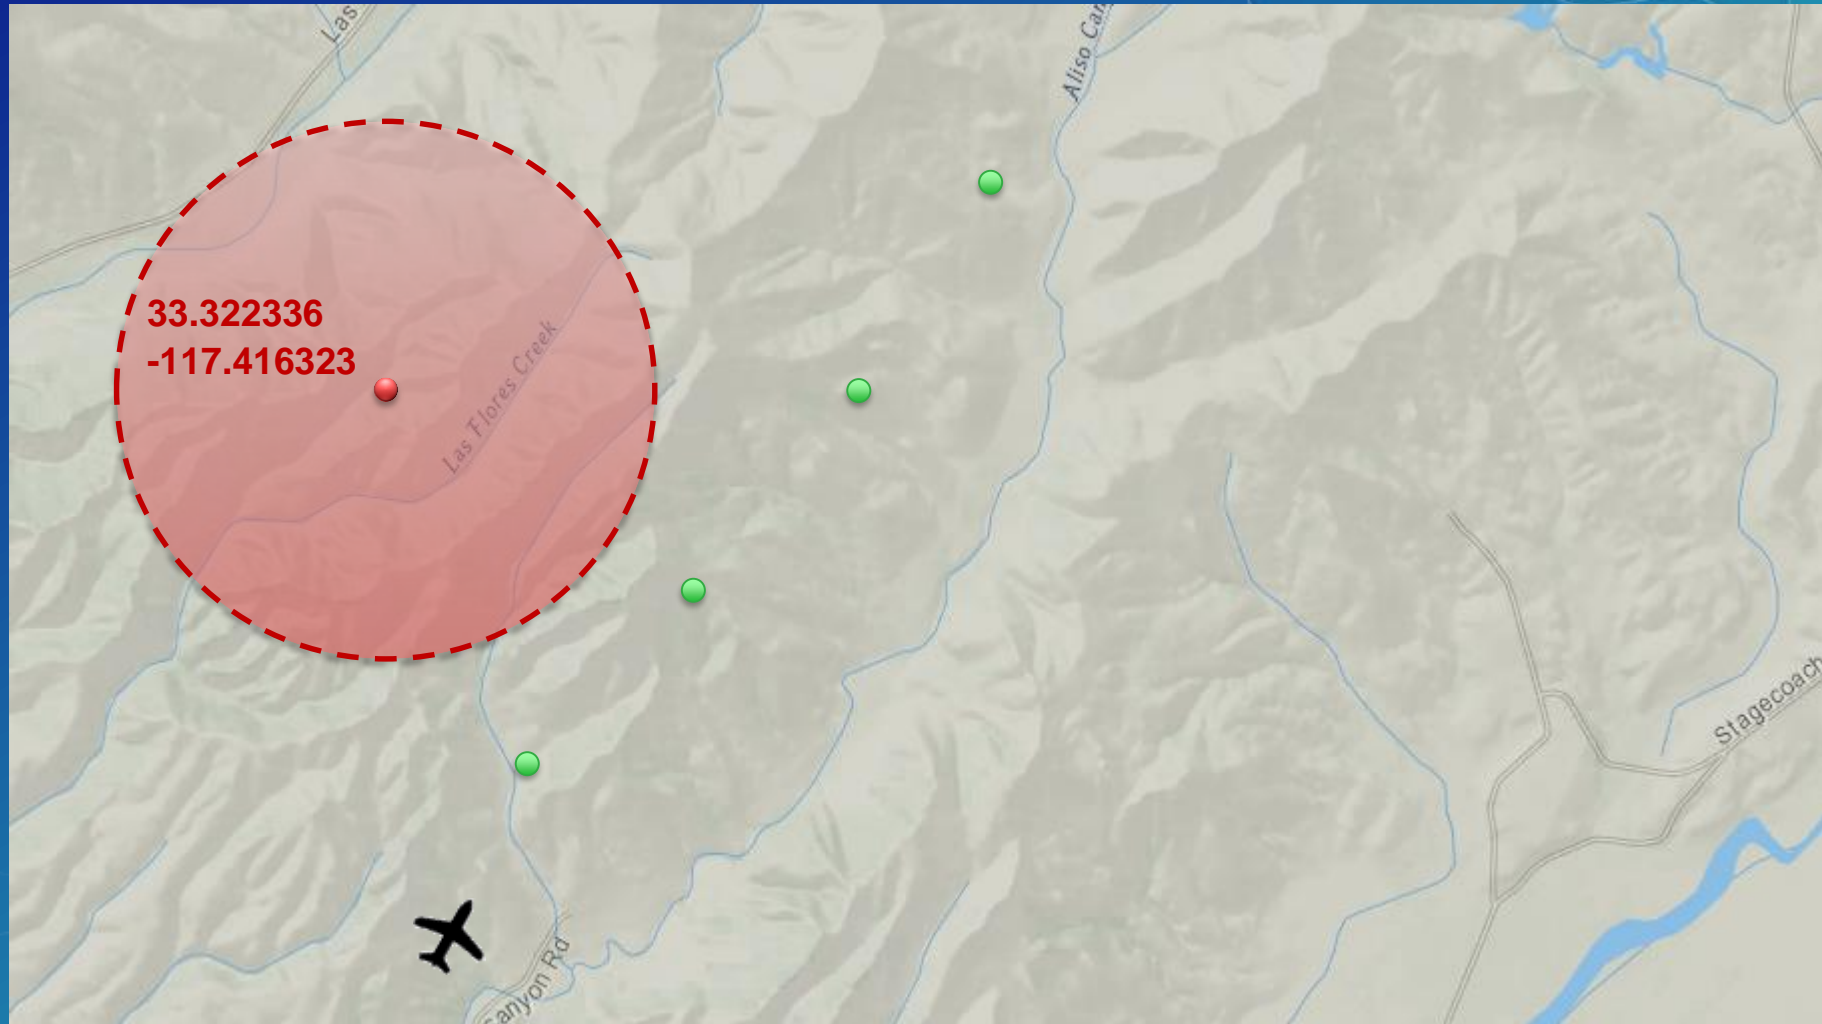

GeoFences

Synchronize GeoEvent Server with a stream service

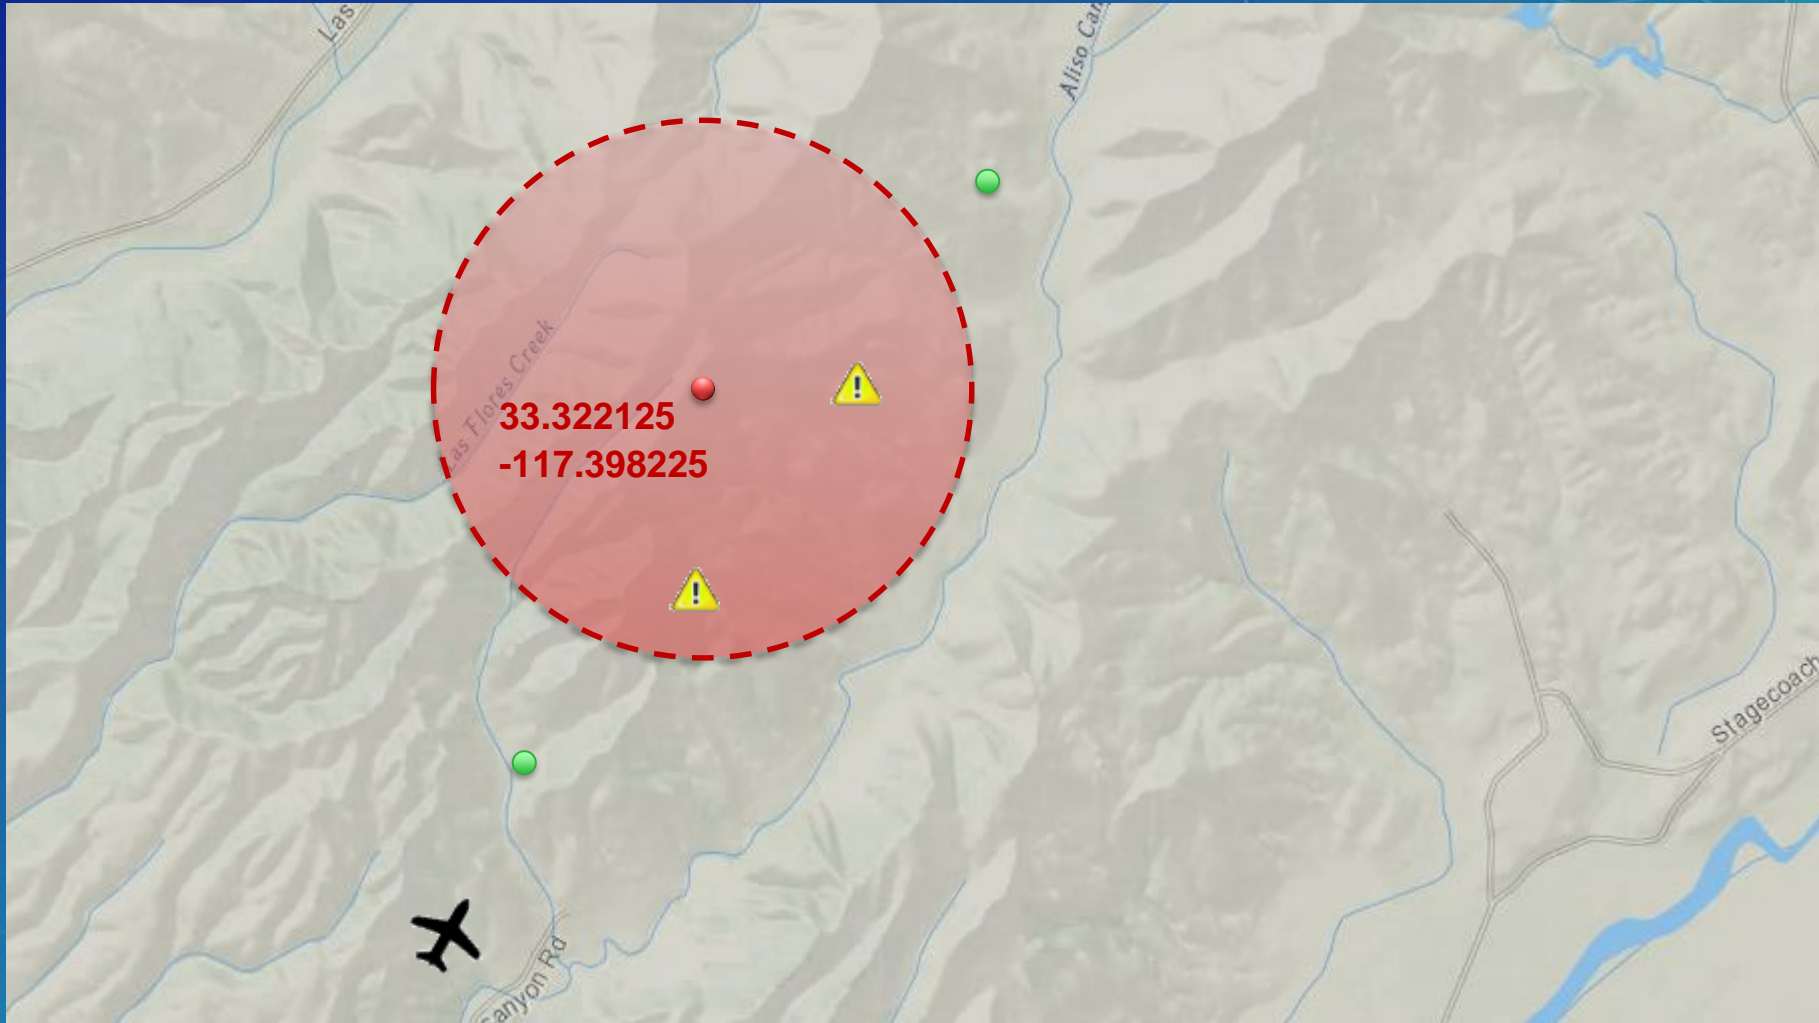

- GeoFences are constantly updated
 - Allows geofences to become dynamic
- Requires active management and purging of geofences as they expire

Dynamic GeoFences

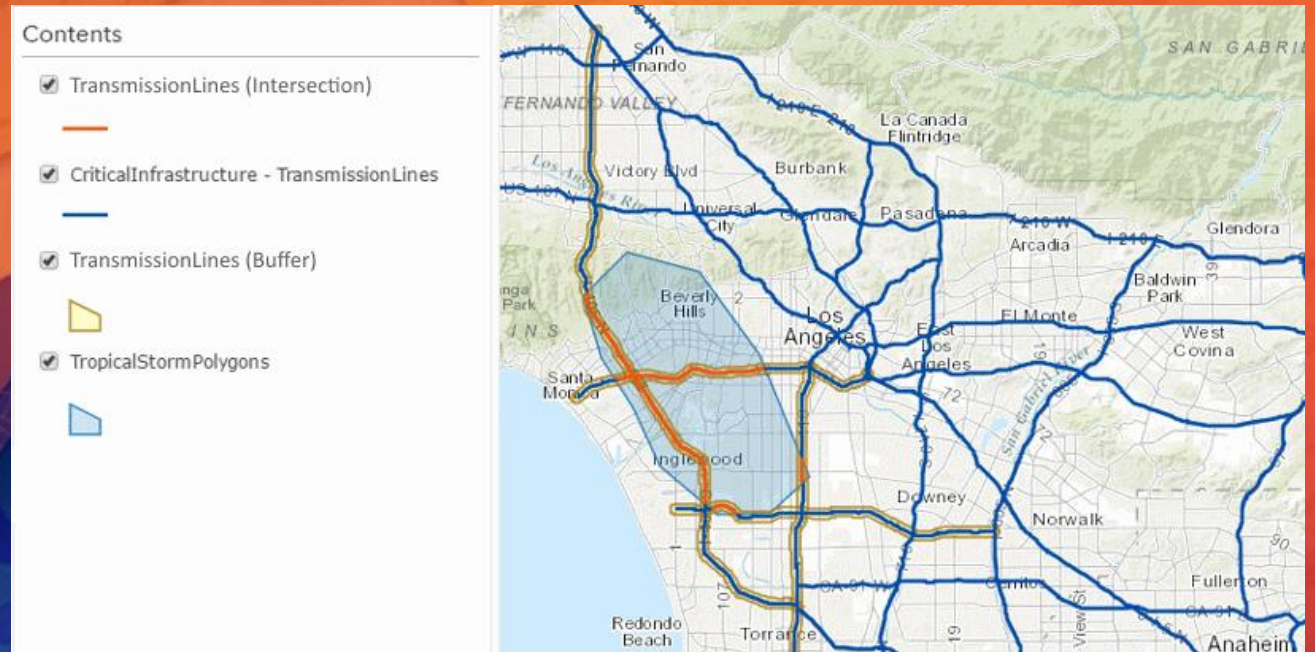

Dynamic GeoFences

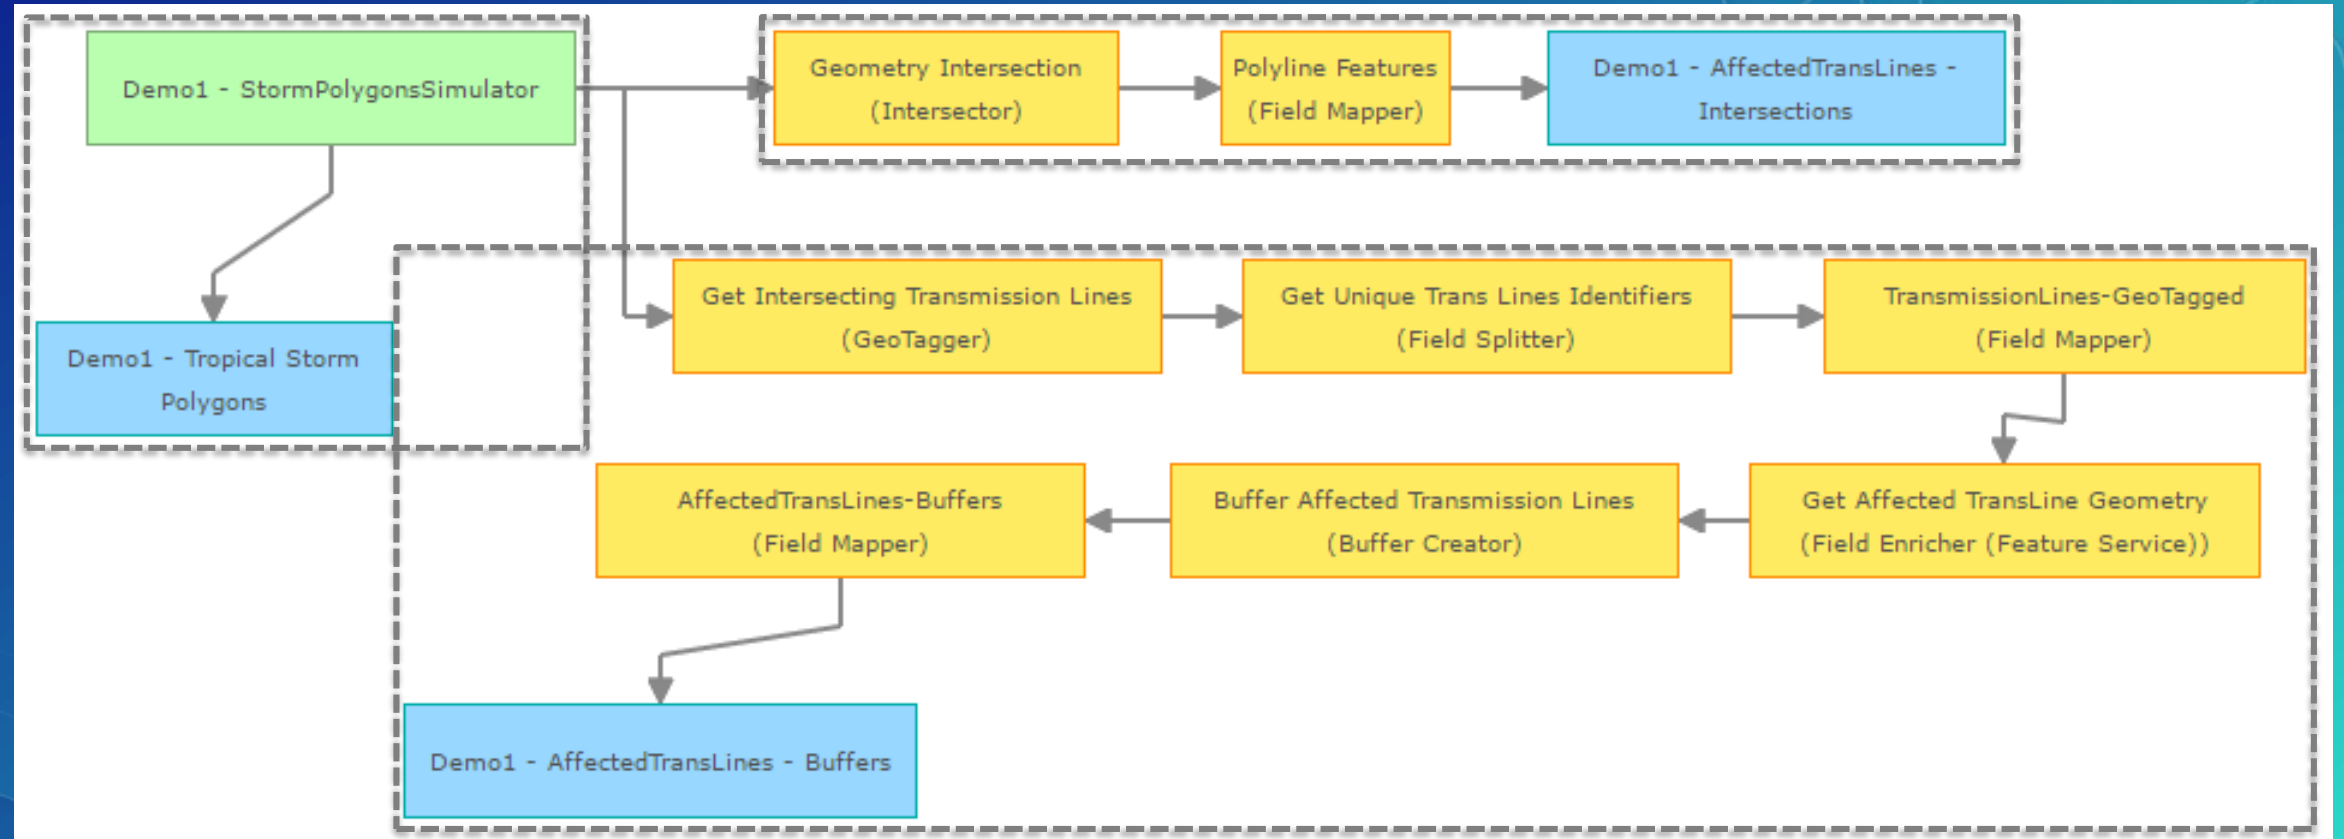

2

Identifying Conditions (demo)

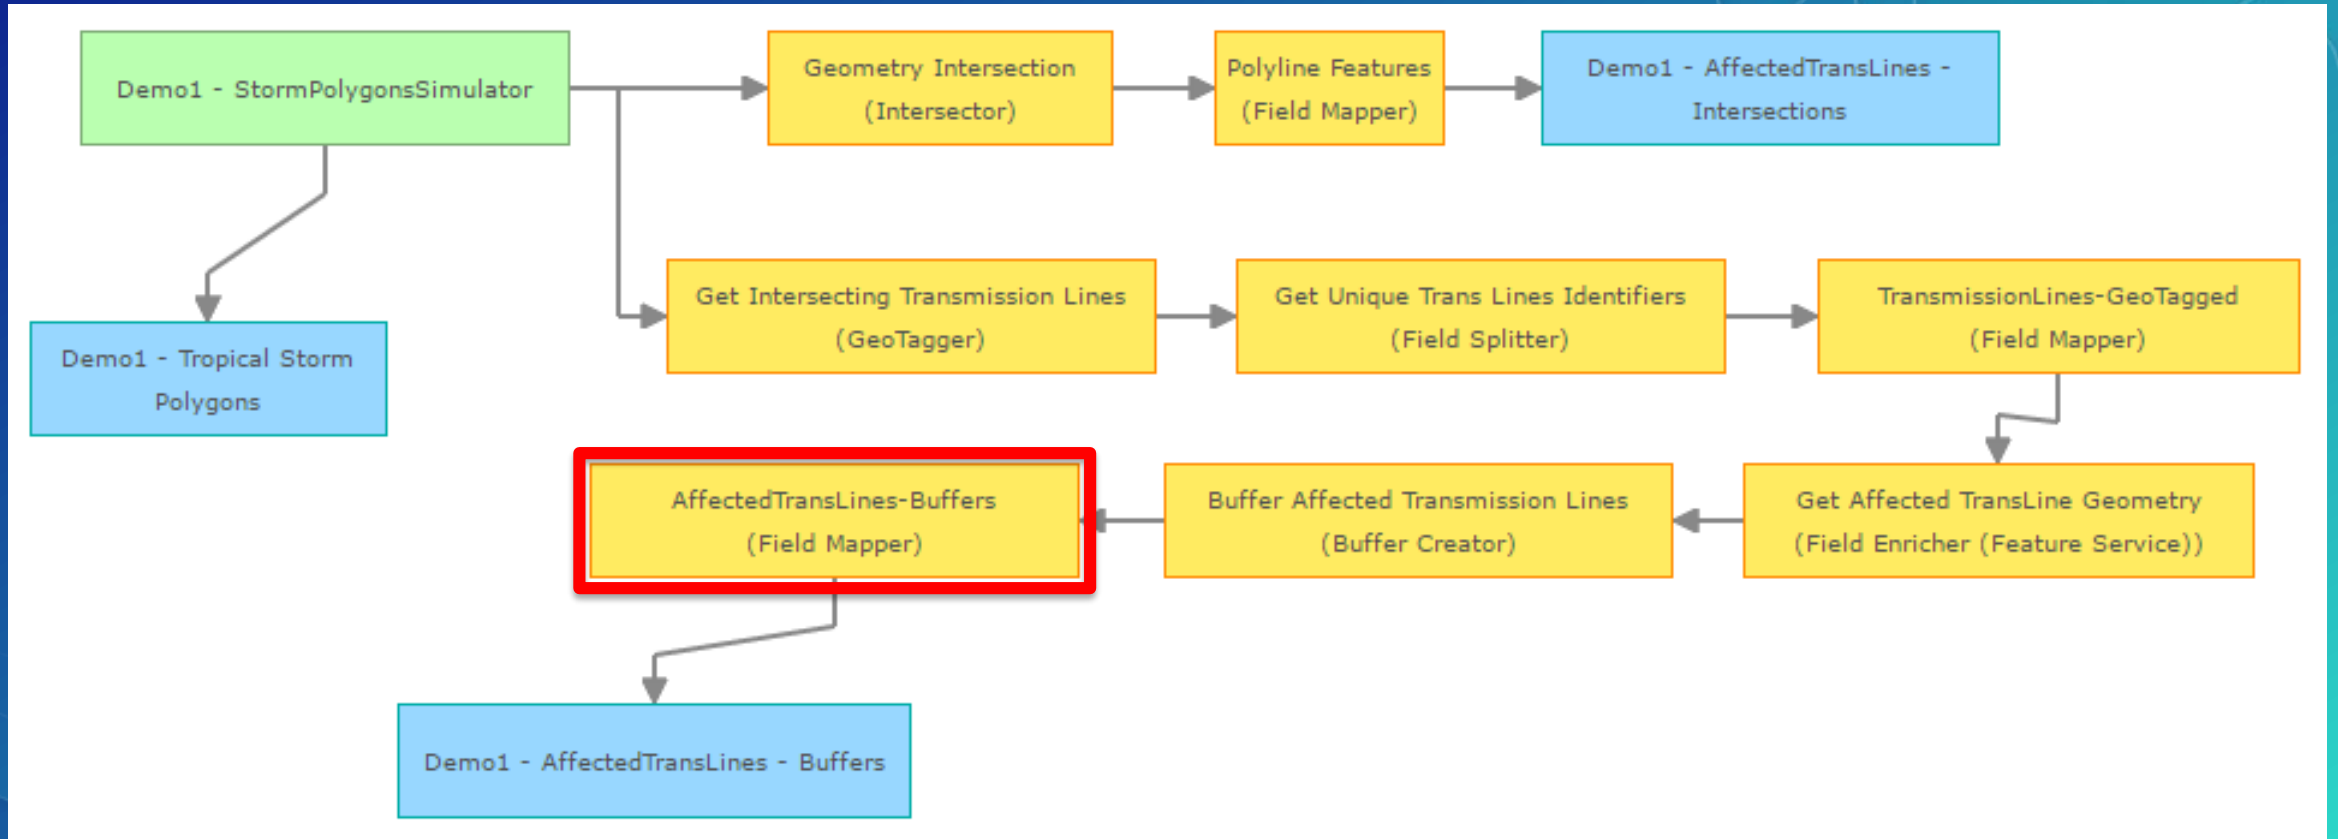

Identifying conditions with real-time data

GeoEvent Service example

Identifying conditions with real-time data

GeoEvent Service example

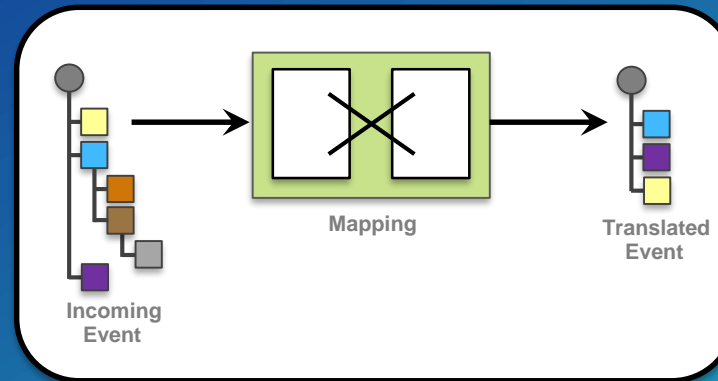

Field Mapper processor

- Adjust the format of a GeoEvent
- Translates from one GeoEvent Definition to another
- Specifies how fields map across the GeoEvent Definitions

Field Mapper processor

Identifying conditions with real-time data

GeoEvent Service example

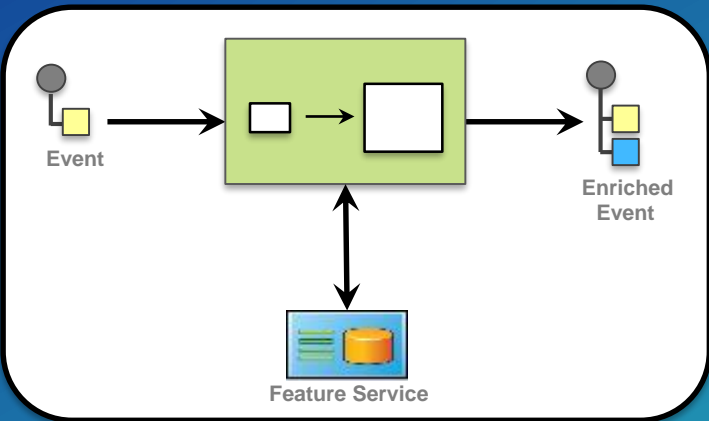

Field Enricher processor

- Enrich a GeoEvent with new fields
- Uses an attribute join to retrieve values from an external table
- After the Field Enricher retrieves the required data from a data source it enriches the GeoEvent with new fields derived from the source

Field Enricher processor

TrackID	V10987

Identifying conditions with real-time data

GeoEvent Service example

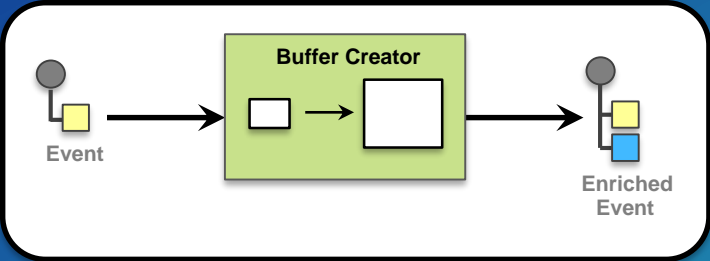

Buffer Creator processor

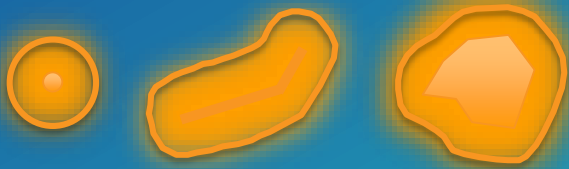

- **Constructs a polygon around an event's point, polyline, or polygon geometry**
- **Can enrich an event record (adding a new geometry field)**
- **Can also replace an event record's geometry**

Buffer Creator processor

TrackID	S90909

Finding patterns in real-time data

GeoEvent Service example

Finding patterns in real-time data

GeoEvent Service example

Field Calculator processor

- Calculate new fields on a GeoEvent
- Uses an expression to calculate a new field or update an existing field
- Expressions can be mathematical expressions, string operations, or function invocations which use regular expressions

Field Calculator processor

TrackID	V10987
Date	1405176845553
BatteryLevel	Low
Distance	105.6
Speed	1.2
Course	186.4

4

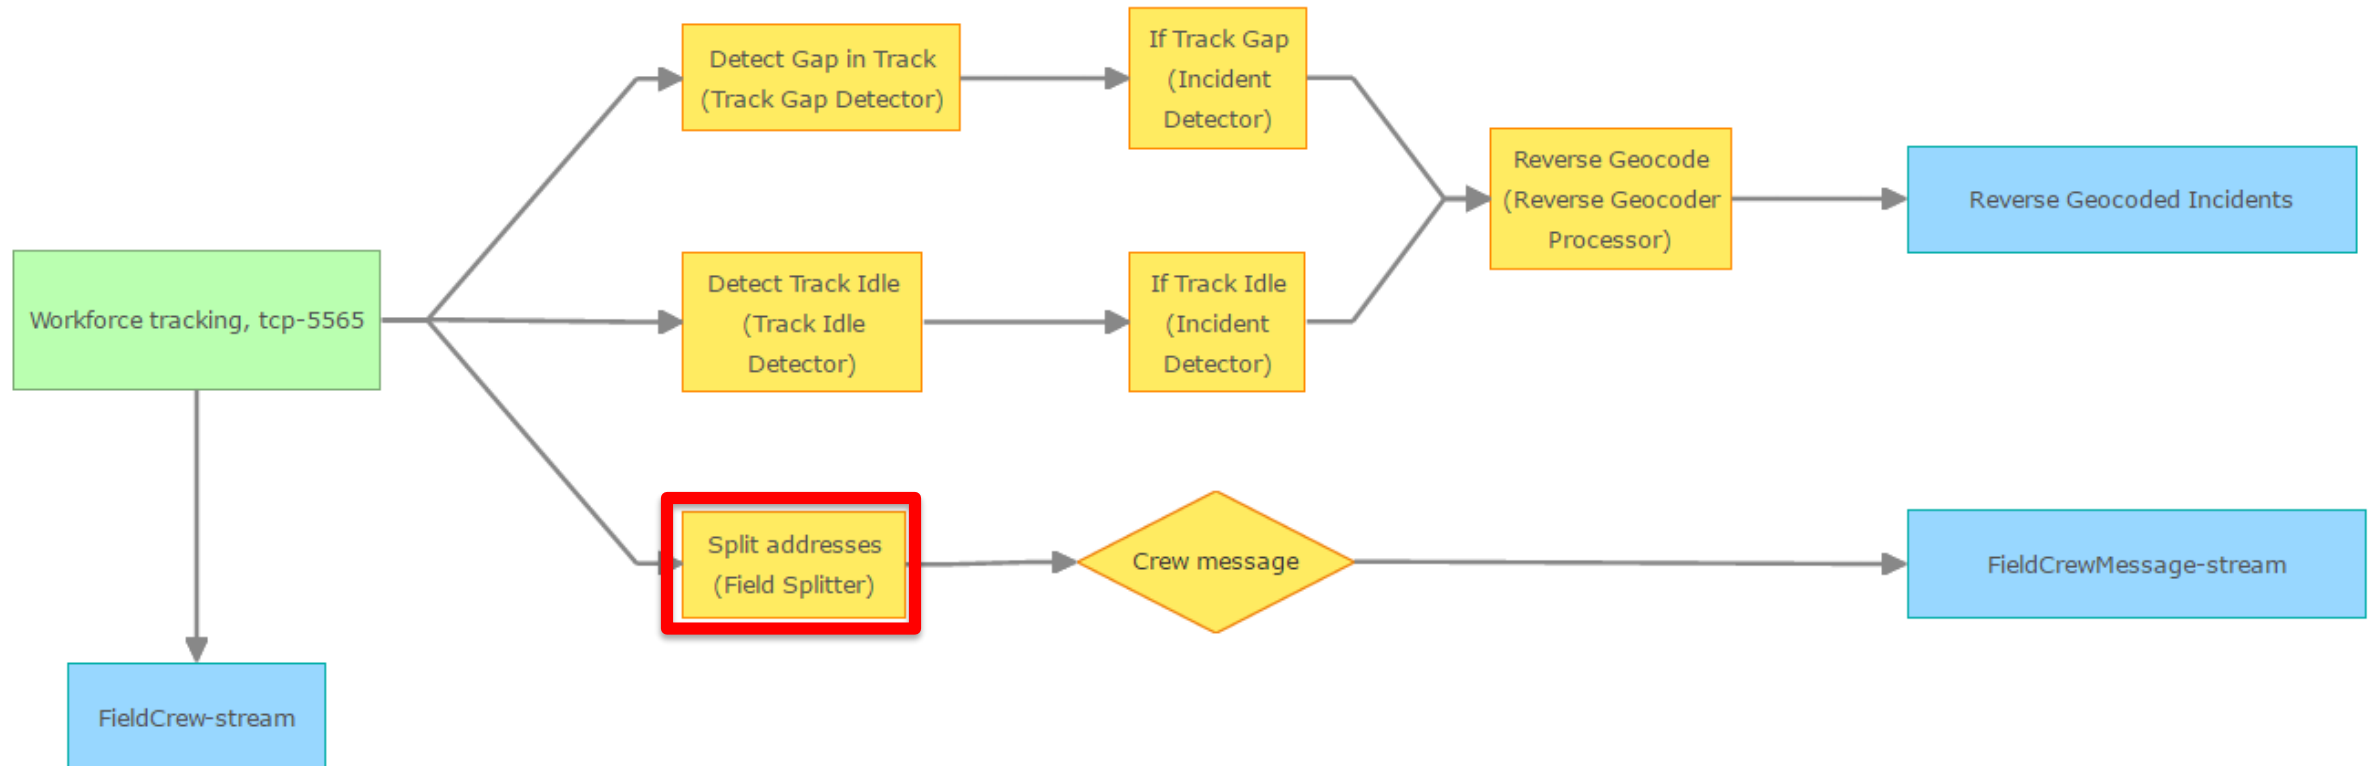

Workforce Tracking (demo)

Workforce Tracking

Workforce Tracking – Field Splitter

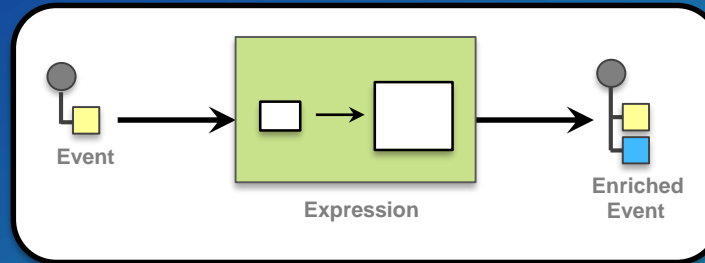

Field Splitter processor

- Splits delimited lists into multiple GeoEvents
- Lists can be a single delimited string (e.g. comma delimited values)
- A multiscardinal version of this processor can handle more complex lists

Field Splitter processor

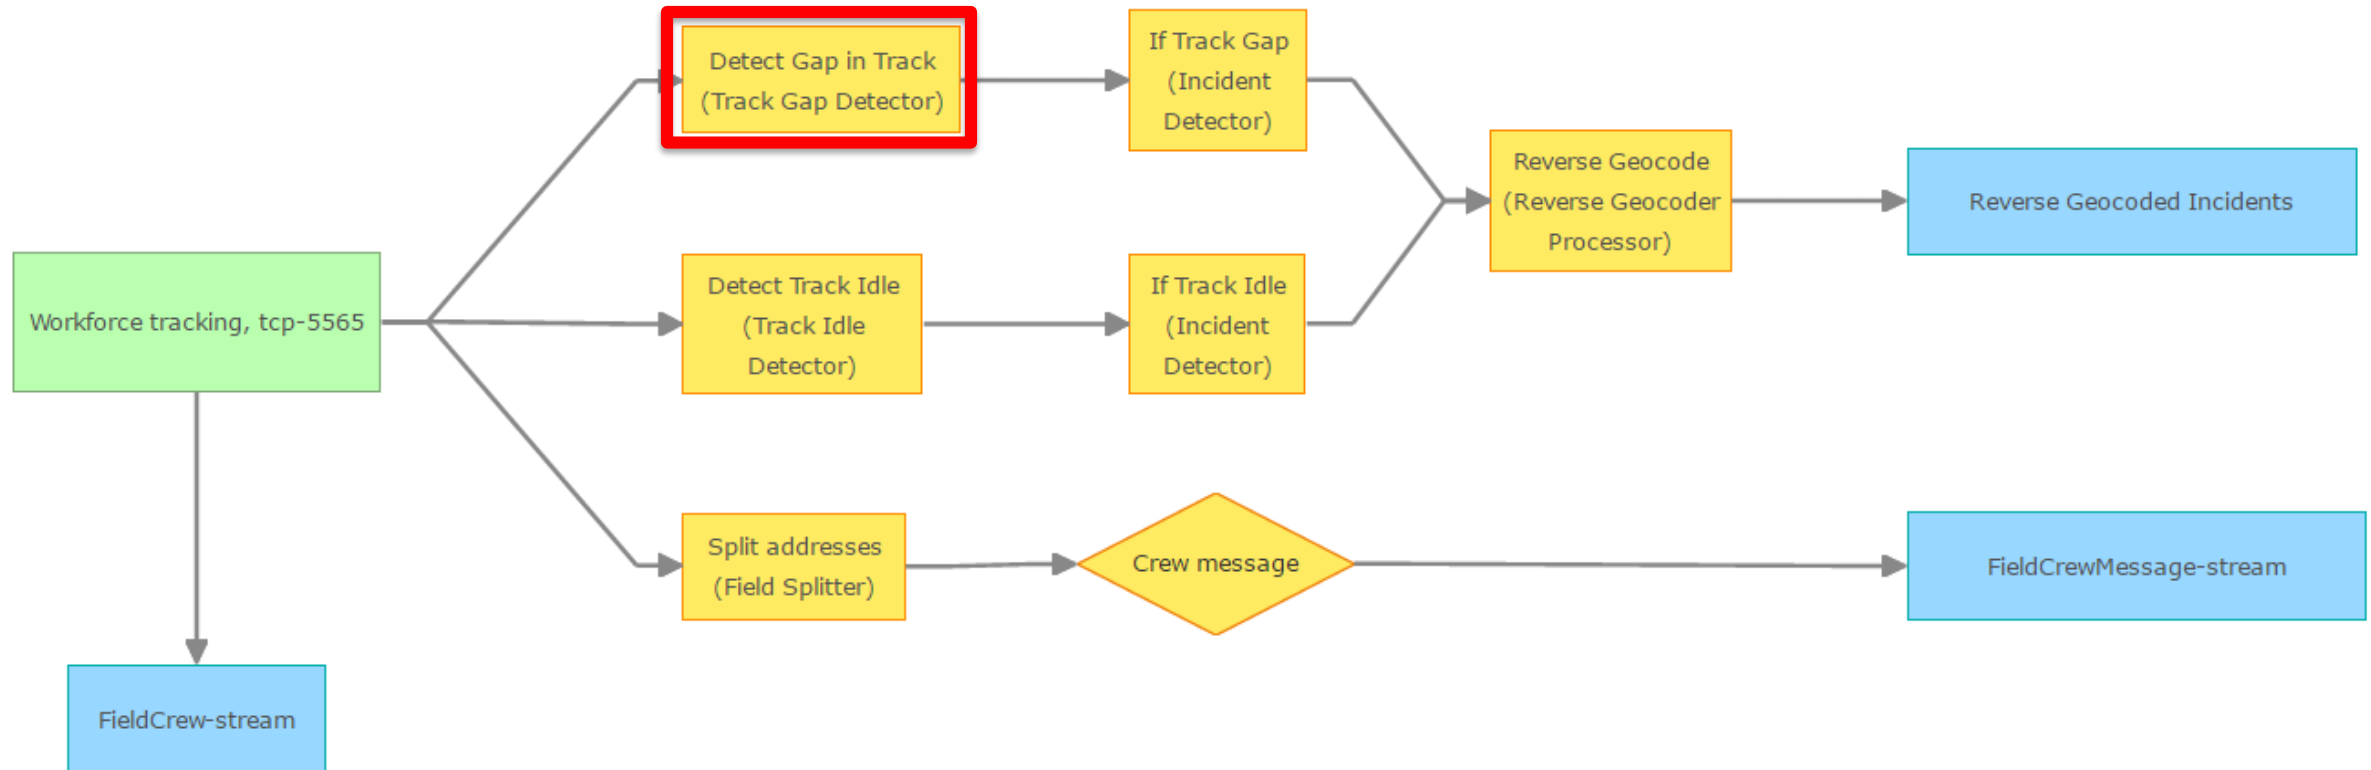

TrackID	V10987
Date	1405176845553
BatteryLevel	Low
msgCode	1
freeText	"stopped for fuel and lunch"
Addresses	"5712940342, admin@inspections.com"
geometry	-117.123..., 36.064...

TrackID	V10987
Date	1405176845553
BatteryLevel	Low
msgCode	1
freeText	"stopped for fuel and lunch"
Addresses	"5712940342"
geometry	-117.123..., 36.064...

Date	1405176845553
BatteryLevel	Low
msgCode	1
freeText	"stopped for fuel and lunch"
Addresses	"admin@inspections.com"
geometry	-117.123..., 36.064...

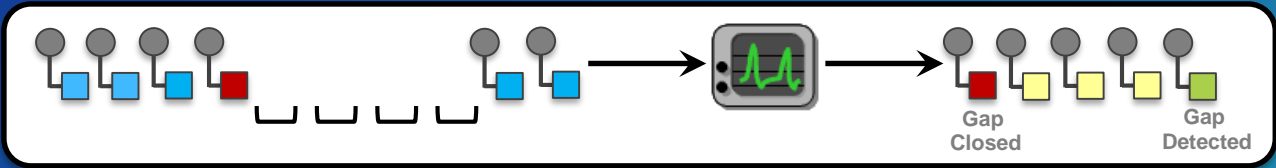

Workforce Tracking – Track Gap Detector

Track Gap Detector

- Detects the absence of events
- Enables alerts and notifications that expected data was not received

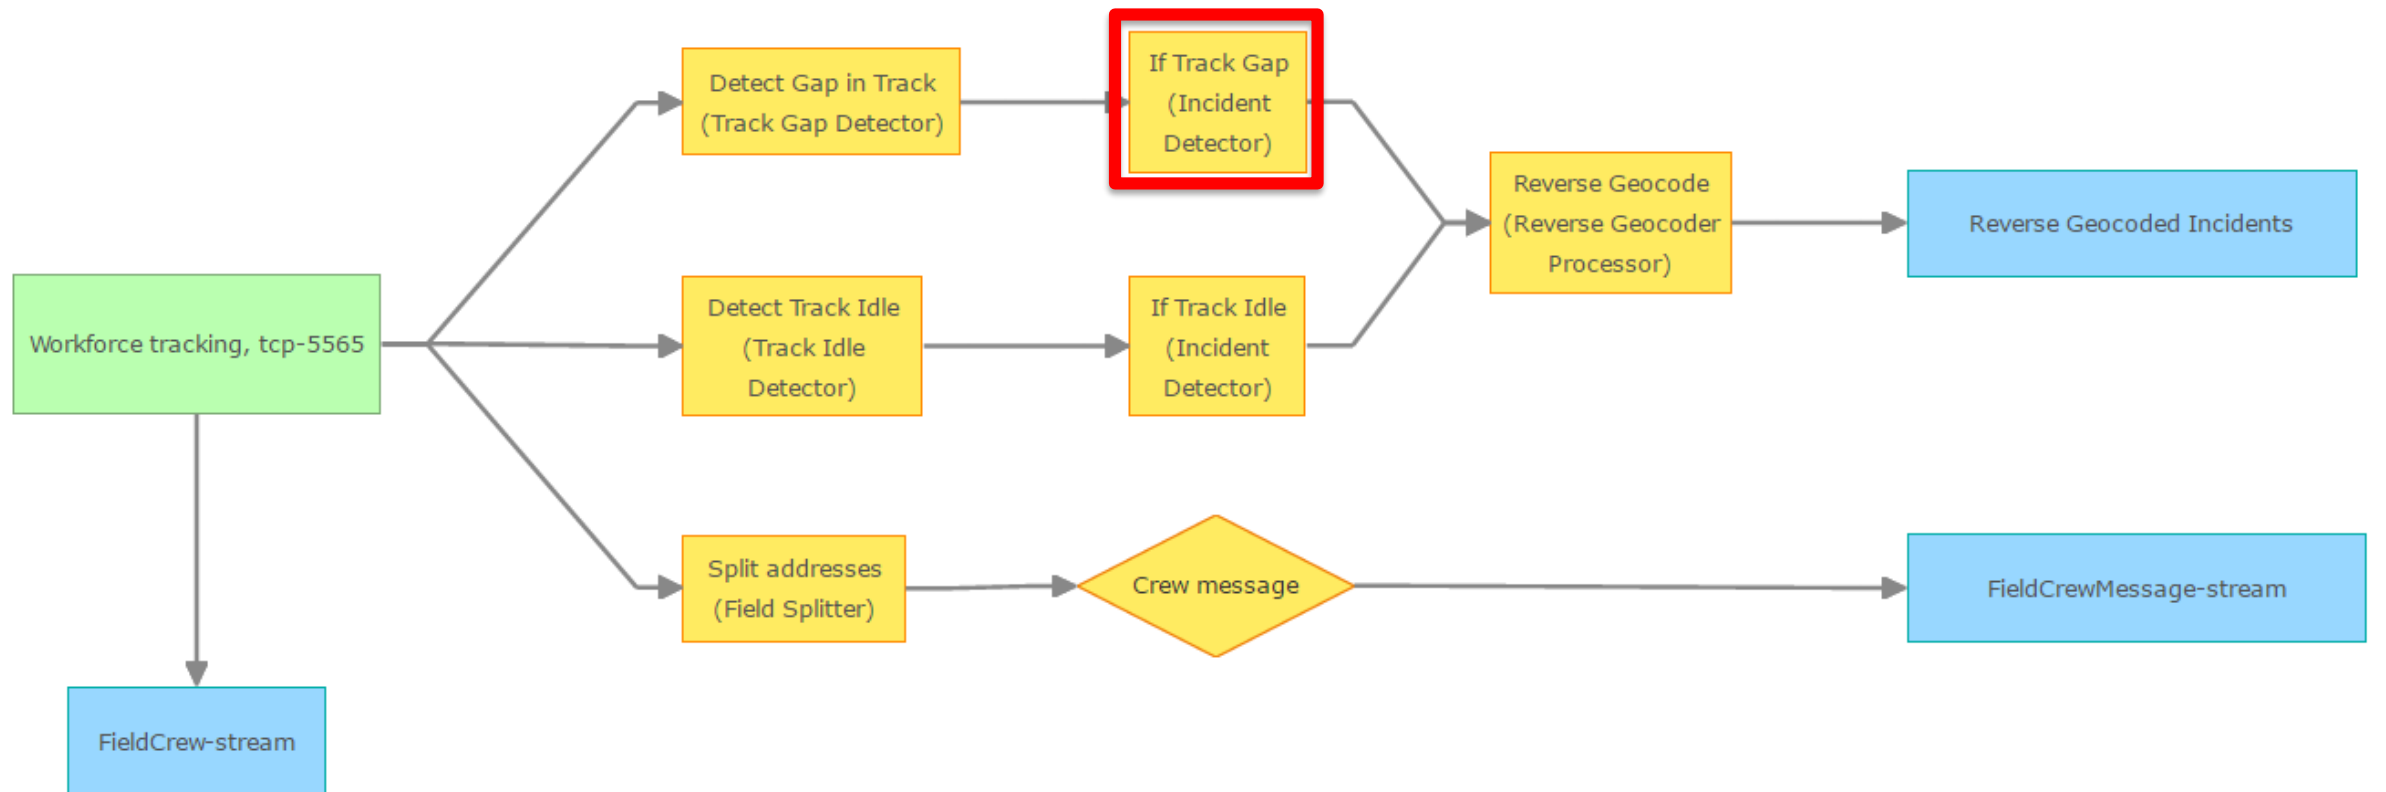

Track Gap Detector

TrackID	V10987
Date	1405176945553
Geometry	-117.123..., 36.064...

trackId	V10987
gap	false
lastReceived	1405176915553
geometry	-117.123..., 36.064...

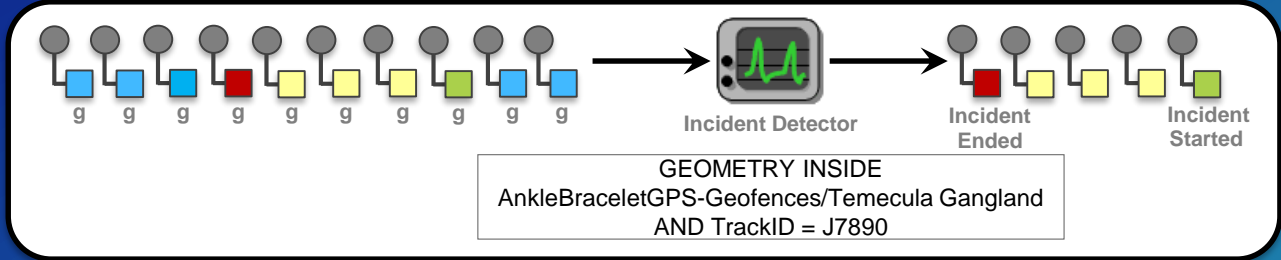

Workforce Tracking – Incident Detector

Incident Detector

- **Detect that a condition has occurred and monitor its duration**
- **Uses filter expressions as opening and closing conditions**
 - Maintains state for the duration of an incident
 - Closes the incident based on a closing expression or expiration

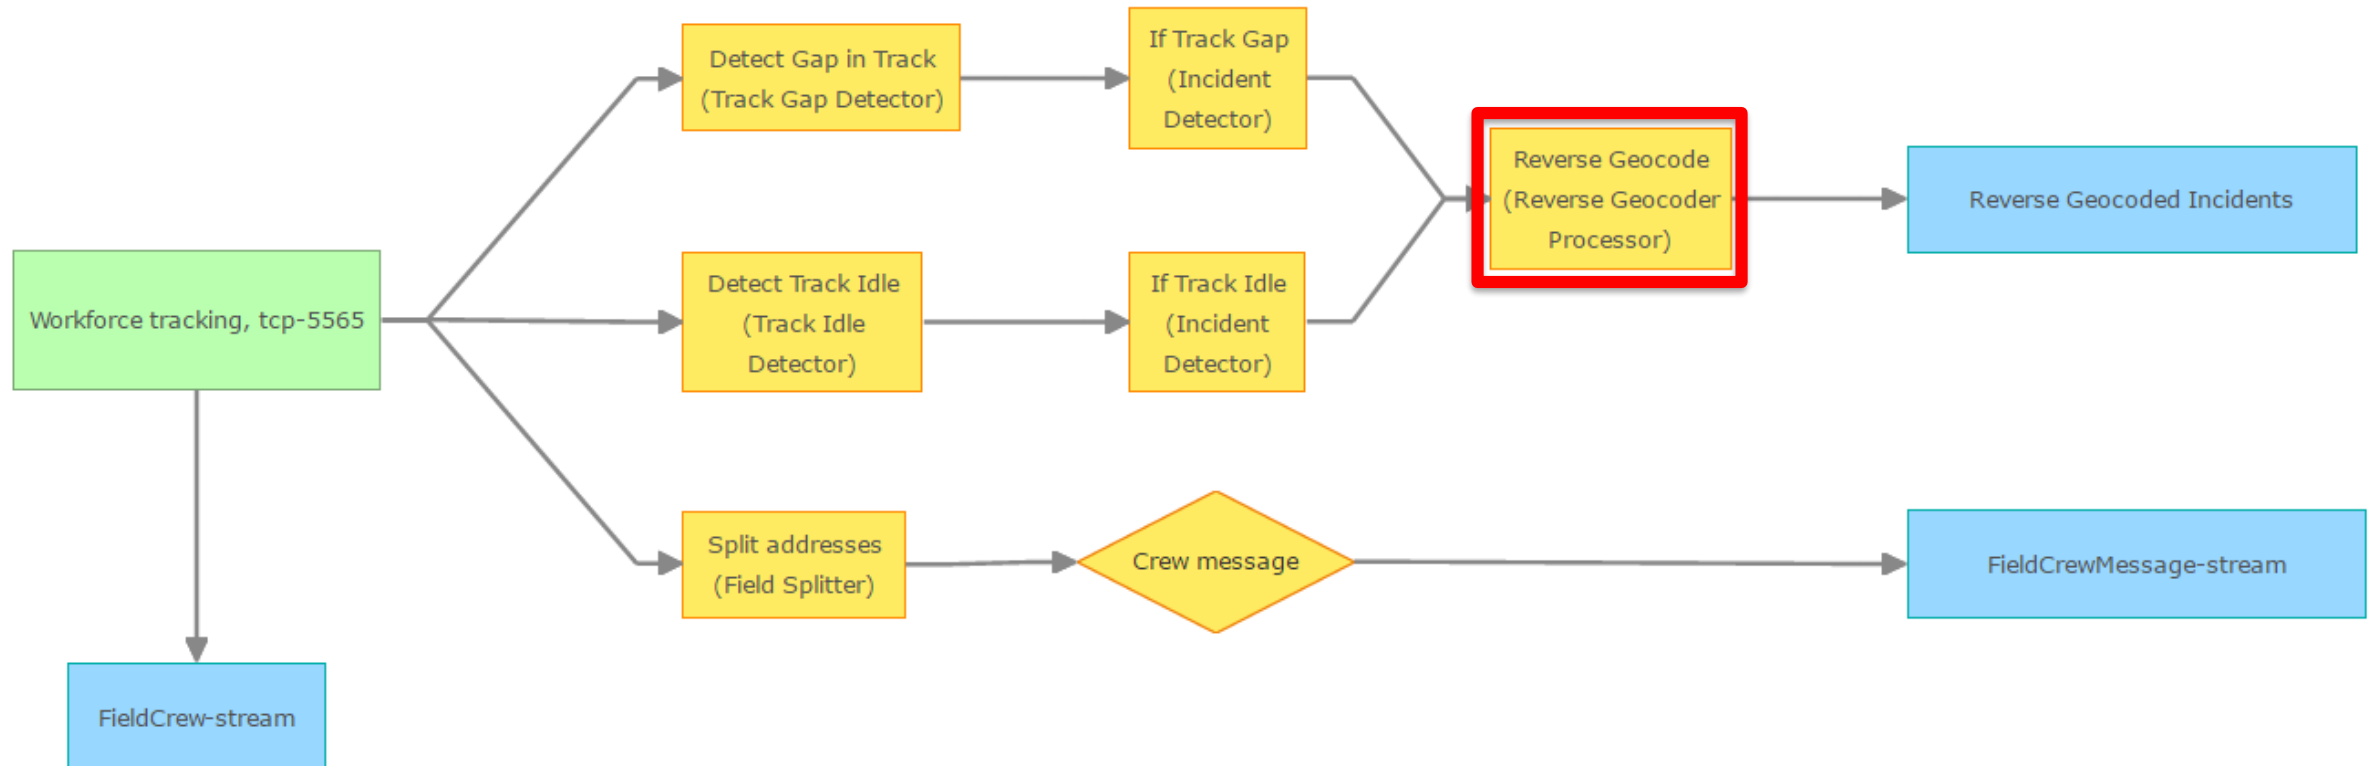

Incident Detector

TrackID	J7890
Date	1405176935553
BatteryLevel	Medium
Distance	0.01
DurationMin	1.03
SpeedMPH	0.62

Workforce Tracking – Reverse Geocoder

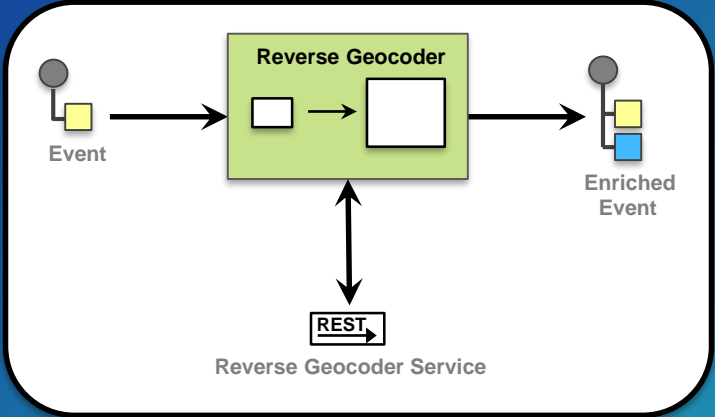

Reverse Geocoder processor

- An example of a custom processor
- Enrich a GeoEvent with the street address nearest to the event's location
 - Uses a point geometry on the incoming event record to perform a reverse geocode
 - Enriches the event record with new field(s) representing a matched address

Reverse Geocoder processor

TrackID	J7890
Date	1405176845553
Sensor	2
BatteryLevel	Medium

Loc_name	USA.PointAddress

Summary & Resources

Summary

Applying real-time analytics

- **ArcGIS is a dynamic platform that enables continuous analytics and real-time visualization for better understanding of our world**
- **The ArcGIS GeoEvent Server allows you to:**
 - know what is happening, as it happens
 - react and make smarter decisions faster
 - be notified when interesting events occur

Summary

Self-paced training and introductions to GeoEvent Server

- **Step-by-Step Tutorials, free to download**
 - Introduction
 - Stream services
 - Spatiotemporal Big Data Store
 - Notifications
- **Blogs and discussions on the forum**
 - <http://links.esri.com/geoevent-forum>
- **Video recordings of technical workshops**
 - <http://www.esri.com/videos>
