# Overview of Visibility Analysis

- Core concepts
  - Analysis capabilities
    - How to access/use the tools
    - Demonstrations
    - Questions & Answers

# Visibility Concepts

Understanding terminology

# Understanding the Observer and Target

# Controlling the Observer

Viewshed frustum defined by:

- Azimuth and vertical angle range
- Visible distance range
- Observer and target offset

# Examples of Observer Profiles

## Spherical Observer

Azimuth :::  $0^{\circ}$  to  $360^{\circ}$   
Vertical Angle :::  $-90^{\circ}$  to  $90^{\circ}$   
Distance ::: 0 to 100 meters

## Hemispherical Observer

Azimuth :::  $0^{\circ}$  to  $360^{\circ}$   
Vertical Angle :::  $-90^{\circ}$  to  $90^{\circ}$   
Distance ::: 45 to 100 meters

## Offset Frustum

Azimuth :::  $0^{\circ}$  to  $360^{\circ}$   
Vertical Angle :::  $-60^{\circ}$  to  $-90^{\circ}$   
Distance ::: 0 to 12 meters

## Conical Observer

Azimuth :::  $45^{\circ}$  to  $90^{\circ}$   
Vertical Angle :::  $-60^{\circ}$  to  $-90^{\circ}$   
Distance ::: 250 to 300 meters

# Atmospheric Refraction

- Bending of light passing through the atmosphere
- Influenced by variations in air pressure, density, humidity, temperature & elevation
- Refraction coefficient supported in:
  - ↳ Line of sight
  - ↳ Skyline
  - ↳ Viewshed
  - ↳ Solar radiation

# Visibility Analysis

Summary of 3D Analyst Capabilities

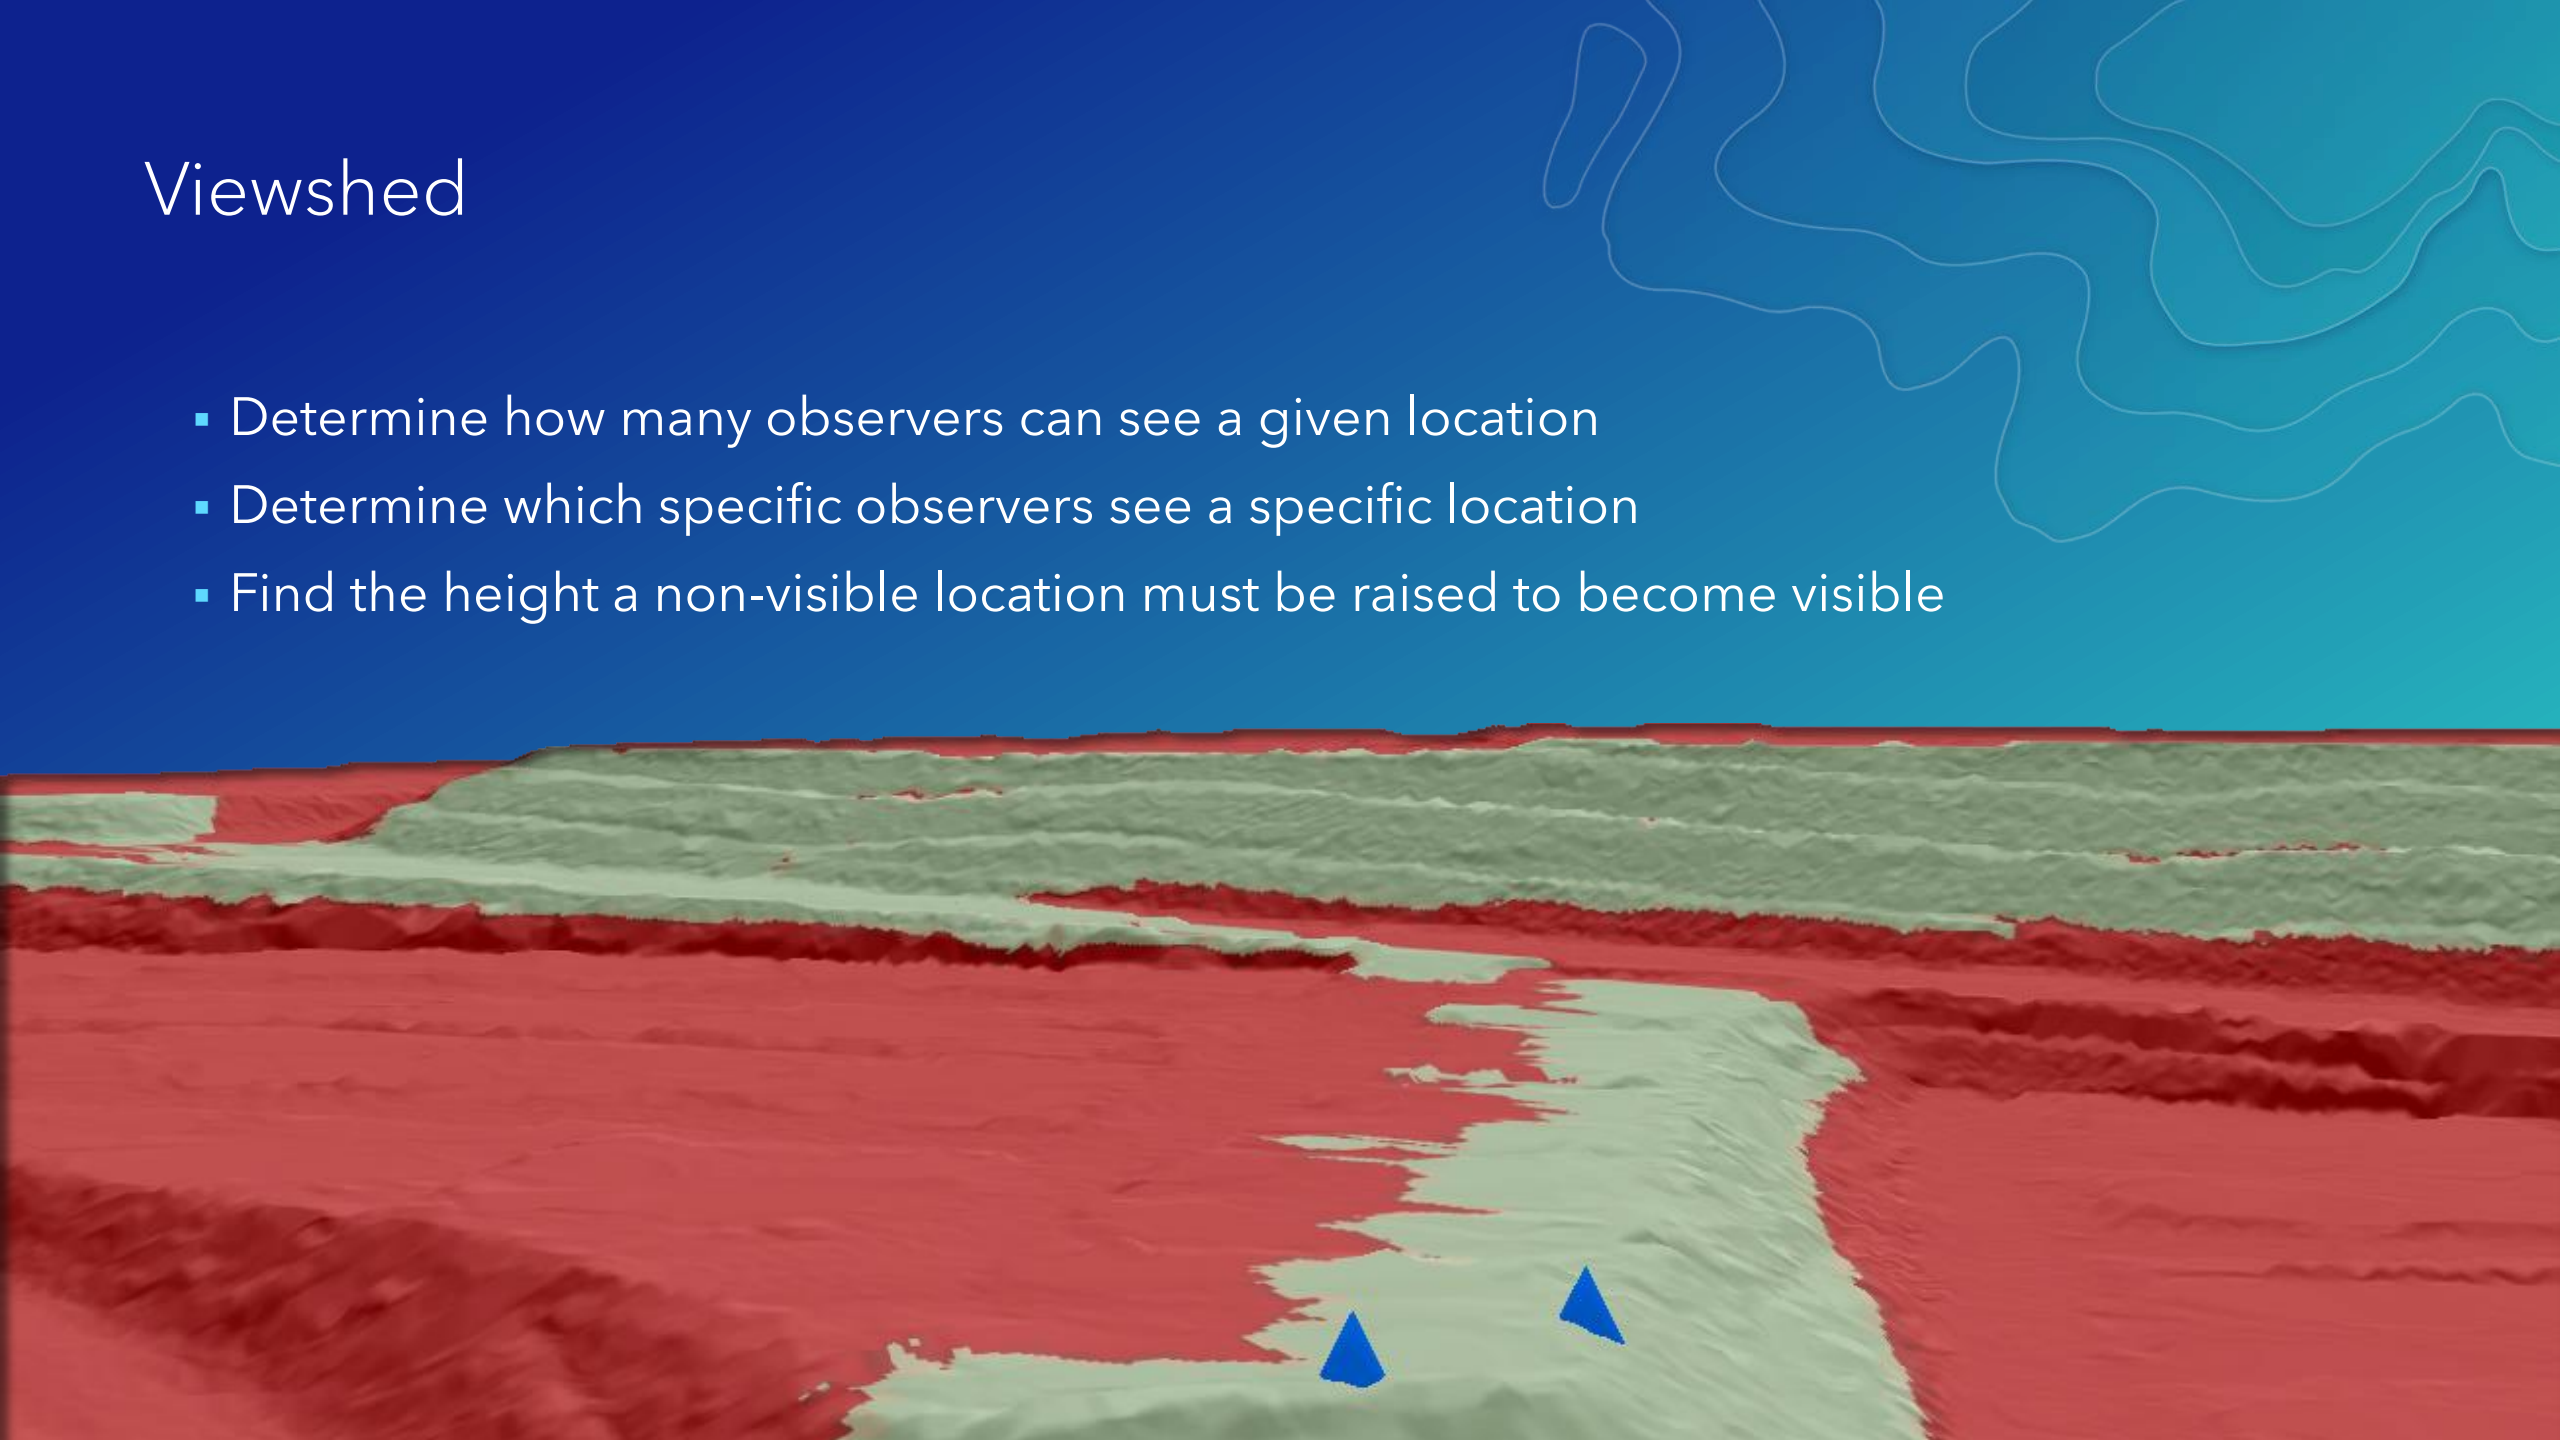

# Line of Sight

- Determine visibility along a line in true 3D space
- Identify points of obstructions
- Sight lines can be constructed from observer points and target features of any kind

# Viewshed

- Determine how many observers can see a given location
- Determine which specific observers see a specific location
- Find the height a non-visible location must be raised to become visible

# Skyline Analysis

- Delineate the horizon
- Segment the horizon by contributing feature
- Graph the percent of obstructed sky

# Skyline Barrier

- Create closed volumes representing an observer's visible frustum
- Perform inside/outside tests using the resulting geometry
- Model shadows cast by localized light sources

# Sun Shadow Volume

- Determines shadows cast by 3D features
- Creates closed volumes that can be used in overlay analysis
  - Find what features intersect or are entirely contained by one or more shadows
  - Right-to-light studies
  - Urban heat island estimation

# Hillshade

- Localized illumination from a fixed trajectory of light
- Provides 3D feel to a 2D map
- Can be used to create a “bone map” which offers a planimetric view that can identify features

# Using Visibility Analysis

How To Leverage Analysis Capabilities

Interpolate Geometry: Creates 3D features based on surface Z.

**Steepest Path:** Determines steepest path from select point.

Interpolate Geometry: Creates 3D features based on surface Z.

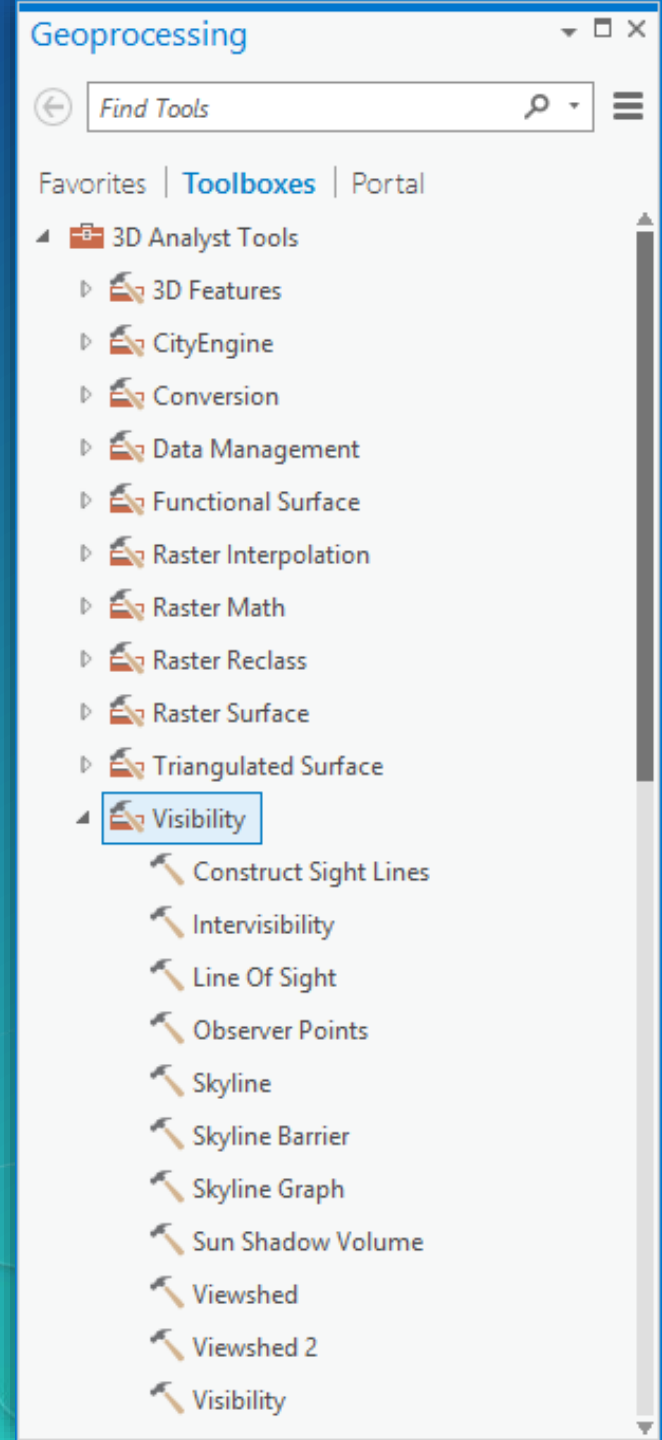

Contour:  Creates a single isoline at the selected point.

**Profile:** Creates profile graph of surface or point cloud.

**Line of Sight:** Determines visibility of sight line & identifies possible obstructing point

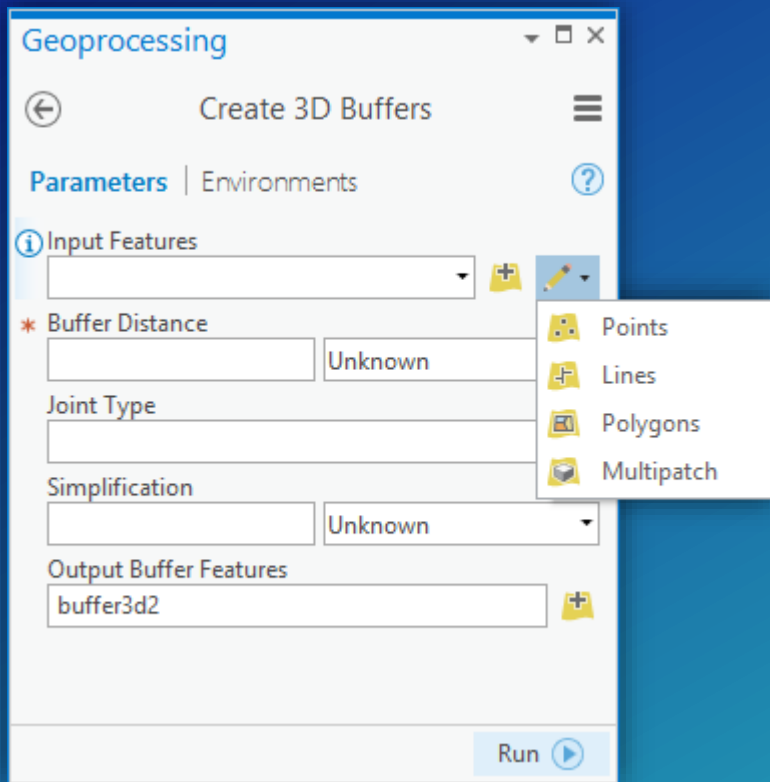

# Visibility Analysis Geoprocessing Tools

- Tools provide individual analysis operations that can be combined to accomplish complete workflows
- Tools can be chained using:
  - Model Builder
  - Python
  - Task

# Interactive Inputs for Geoprocessing

- Point, line and polygon geometry can be interactively defined for tools
- Many geoprocessing tools now also support this capability directly
- Feature set control can be assigned for custom script tools and models
